Several devices for using ink were afterward substituted for the style. In Bain's chemical recorder the dots and dashes were registered by

Morse key and Register: *a*, *a'*, electromagnets; *b*, lever of the armature, carrying at *c* an inked wheel, *d*, which presses the paper against the roller *e* as the armature is attracted; *f*, spring to draw back the armature when the current ceases; *g*, paper; *h*, *h'*, rollers; *i*, *i'*, adjusting-screws for the lever-spring.

the chemical decomposition of some substance with which the paper was impregnated, the decomposition being produced on the passage of a current of electricity. of which dips into a vessel of ink, and the other moves back and forth at right angles to a strip of paper which is regularly moved by clockwork. The electrification of the ink causes it to be projected from the end of the tube in minute drops so that the movements of the coil are recorded on the slips of paper in very fine dots very near one another. The principal advantage of this instrument is that only a very feeble current is required to give a permanent record of the signals.

2. In *ornith.*, a tail-feather; one of the long or large quill-feathers of a bird's tail: so called from its use in directing or steering the course of a bird in flight, like a rudder. The rectrices are comparable to the similar large flight-feathers of the wing, called *remiges*. In the *Saururæ*, or Jurassic birds with long lizard-like bony tail, the rectrices are bi-serially or distichously arranged in a row on each side of the caudal vertebræ. In all modern birds they are set together in a fan-like manner upon the pygostyle. (See *Eurhipidura*.) In a few birds they are rudimentary, as in grebes. The most frequent number by far is twelve, which prevails (with few anomalous exceptions) throughout the great order *Passeres*, and also in very many other birds of different orders. In many picarian birds the number is ten; in a very few eight. In various waterbirds the rectrices run up to higher numbers, twenty-four being probably the maximum. There is normally always an even number, these feathers being paired. In size, shape, and texture they are endlessly varied, giving rise to all the different shapes a bird's tail presents.

rectum (rek'tum), *n.*; pl. *recta* (-tā). [= F. *rectum* = Sp. Pg. *recto* = It. *retto*, < NL. *rectum*, abbr. of L. *rectum intestinum*, the straight intestine: *rectum*, neut. of *rectus*, straight: see *right*.] In *anat.* and *zoöl.*, a terminal section of the intestine, ending in the anus: so called from its comparatively straight course in man; the lower bowel: more fully called *intestinum rectum*. In man the rectum is the continuation of the sigmoid flexure of the colon, beginning about opposite the promontory of the sacrum, a little to the left side and running through the pelvis to the anus. It is supported by a proper duplication of peritoneum, the mesorectum, and other fascie. Its structure includes well-developed longitudinal and circular muscular fibers, the latter being aggregated into a stout internal sphincter muscle near the lower end. In animals whose colon has no special sigmoid flexure there is no distinction of a rectum from the rest of the large intestine; and the term applies only to any given or taken terminal section of the bowel, of whatever character. In mammals above monotremes the rectum is entirely shut off from the urogenital organs, ending in a distinct anus; but in most animals it ends in a cloaca common to the digestive and urogenital systems. The rectum receives the refuse of digestion, and retains the feces until voided. See cuts under *intestine*, *peritoneum*, *Pulmonata*, *Pycnogonida*, *Appendicularia*, and *Blattidæ*.—**Columns of the rectum**. See *column*.

Same as *pyramidalis(a)*.—**Rectus abdominis internus**, the straight muscle of the abdomen, in the middle line in front, mostly inclosed in an aponeurotic sheath formed by the tendons of other abdominal muscles, usually intersected by several transverse tendons, and extending from the pubis to the sternum, in some animals to the top of the sternum.—**Rectus femoris**, the anterior part of the quadriceps extensor. It is a fusiform, bipennate muscle, arising by two heads from the ilium, and inserted into the base of the patella. See cut under *muscle*1.—**Rectus lateralis**, the lateral straight muscle of the head, arising from the transverse process of the axis, and inserted into the jugular process of the occipital.—**Rectus medialis oculi**. It is not a *recusancy*, for I would come; but it is an excommunication, I must not.
Donne, Devotions, III., Expostulation.

If any one, or two, or ten, or twenty members of congress should manifest symptoms of *recusancy*, . . . the weird sisters of ambitious hearts shall play before their eyes images of foreign missions, and departments, and benches of justice. *R. Choate*, Addresses, p. 339.

2. The state of being a recusant.

The papists made no scruple of coming to our churches; *recusancy* was not then so much as a curtsom, not an embryo. *Jer. Taylor*, Works (ed. 1835), II. 98.

There is also an inferior species of *recusancy* (refusing to make the declaration against popery enjoined by statute 30 Car. II. st. 2, when tendered by the proper magistrate). *Blackstone*, Com., IV iv.

Bancroft, Hist. U. S., II. 411.

2. Specifically, in *Eng. hist.*, one who refused to attend divine worship in Anglican churches, or to acknowledge the ecclesiastical supremacy of the crown. Heavy penalties were inflicted on such persons, but they pressed far more lightly on the simple recusant or nonconformist than on the Roman Catholic recusant, the chief object being to secure national unity and loyalty to the crown, in opposition to papal excommunications, which declared British subjects absolved from their allegiance (as in 1570), and to plots against the government. The name *recusant*, though legally applied to both Protestants and Roman Catholics, was in general given especially to the latter.

As well those restrained . . as generally all the papists in this kingdom, not any of them did refuse to come to our church, and yield their formal obedience to the laws established. And thus they all continued, not any one refusing to come to our churches during the first ten years of her Majesty's [Queen Elizabeth's] government. And in the beginning of the eleventh year of her reign, Cornwallis, Bedingfield, and Silyard were the first *recusants*, they absolutely refusing to come to our churches. And until they in that sort began, the name of *recusant* was never heard of amongst us.

The long vowel remains, however, in the surnames *Read*, *Reade*, *Reed*, *Reid*, which represent old forms of the adj., and the existence of which as surnames explains the almost total absence of the expected surname *Red*, parallel to *Black*, *Brown*, *White*, etc. As a noun, cf. (*b*) In *com.*, payment to the holders by the issuer of notes, bills, or other evidences of debt. (*c*) In *theol.*, deliverance from sin and its consequences by the obedience and sacrifice of Christ the Redeemer. The word *redemption* presupposes that man is in a state of bondage to the powers of evil—either spiritual powers external to himself, or evil passions and propensities within himself, or both—and that he can be delivered from them only by the sacrifice and suffering of another. This suffering is regarded as the price or ransom paid to redeem the captive. Thus, redemption is substantially equivalent to salvation, but involves the idea of a new and additional right over man acquired by God; and the doctrine of redemption includes the doctrines of atonement, justification, regeneration, and sanctification.

The parts are so arranged that the valve opens to its extreme limit only when the pressure on the delivery side is at a prescribed minimum, closing the part in the valve-seat more or less when this minimum is exceeded. The pressure on the delivery side of the valve is thus kept from varying (except between very narrow limits) from its predetermined pressure, although the pressure on the opposite side may be variable, and always higher than on the delivery side. Such valves are much used for maintaining lower pressures in steam-heating and -drying apparatus than is carried in the boiler. They are also used in automatic air-brakes for railways and in other pneumatic machines, and, in some forms, as gas regulators for equalizing the pressure of gas delivered to gas-burners, etc. Also called *pressure-reducing valve*.

reductio ad absurdum (rē-duk'shi-ō ad ab-sėr'-dum). [L.: *reductio*, a leading, reduction; *ad*, to; *absurdum*, neut. of *absurdus*, absurd: see *absurd*.] A reduction to an absurdity; the proof of a proposition by proving the falsity of its contradictory opposite: an indirect demonstration. In geometry the reductio ad absurdum consists in drawing a figure whose parts are supposed to have certain relations, and then showing that this leads to a conclusion contrary to a known proposition, whence it follows that the parts of the figure cannot have those relations. Thus, in Euclid's "Elements" the proposition that if a triangle has two angles equal the sides opposite those angles will be equal is proved as follows. In the triangle ABC, let the angles ABC and ACB be equal. Then, suppose AB to be greater than AC. Lay off BD = AC and join DC. Then, comparing the two triangles ACB and DBC, we have in the former the sides AC and BC and their included angle ACB equal in the latter to the sides DB and CB and their included angle DBC. Hence, these two triangles would be equal, or the part would be equal to the whole. This proof is a *reductio ad absurdum*. This kind of reasoning is considered somewhat objectionable as not showing the principle from which the proposition flows; but it is a perfectly conclusive mode of proof, and, in fact, is in all cases readily converted into a direct proof. Thus, in the above example, we have only to compare the triangle ABC with itself, considering it as two triangles according as the angle B is named before C or vice versa. In the triangle ABC the angles B and C with the included side BC are respectively equal in the triangle ACB to the angles C and B with the included side CB; hence the other parts of the triangles are equal, and the side AC opposite the first angle B in the first triangle is equal to the side AB opposite the first angle C in the second triangle.

The disease prevails in various countries in undrained, unimproved meadows and in woods, whence it is also called *wood-evil*. According to some, it is caused by the ingestion of food growing in such localities; others attribute it to rheumatic attacks, resulting from exposure. Redwater is also a prominent symptom of Texas cattle-fever, and occasionally accompanies anthrax in cattle. It is rarely observed among sheep and swine.

It is the only congener of the famous big or mammoth tree, which it almost rivals in size. It grows commonly from 200 to 300 feet high, with a straight cylindrical trunk, naked to the height of 70 or

The bark is from 6 to 12 inches thick, of a bright cinnamon color, the wood is of a rich brownish red hue, straight-grained, easily worked and taking a fine finish, and very durable in contact with the soil. Its wood is widely used as building-timber on the Pacific coast of the United States; in California it is used almost exclusively for shingles, fence-posts, railway ties, telegraph poles, wine-butts, etc.

2. The name is also applied to various other trees. Thus, the East Indian redwoods are *Soymida febrifuga*, also called *East Indian mahogany*; *Pterocarpus santalinus*, the red sandalwood (see *sandalwood*) and *P. The common reed is *Phragmites communis*, a stately grass from 5 to 12 feet high, found in nearly all parts of the world. It serves by its creeping rootstocks to fix alluvial banks; its stems form perhaps the most durable thatch, and are otherwise useful; and it is planted for ornament. See the generic names, and phrases below. Compare *reed-grass*.

4. In *music*: (*a*) In musical instruments of the oboe and clarinet classes, and in all kinds of organs, a thin elastic plate or tongue of reed, wood, or metal, so fitted to an opening into a pipe as nearly to close it, and so arranged that, when a current of air is directed through the opening, the reed is drawn into or driven against it so as to close ., but immediately springs back by its own elasticity, only to be pressed forward again by the air, thus producing a tone, either directly by its own vibrations or indirectly by the sympathetic vibrations of the column of air in the pipe. When the reed is of metal, the pitch of the tone depends chiefly on its size; but when of reed or cane, it may be so combined with a tube that the pitch shall depend chiefly on the size of the air-column. A *free reed* is one that vibrates in the opening without touching its edges: a *beating* or *striking reed* is one that extends slightly beyond the opening. In orchestral instruments, the wood wind group includes several reed-instruments, which have either double reeds (two wooden reeds which strike against each other, as in the oboe, the bassoon, the English horn, etc.), or a single reed (a wooden reed striking against an opening in a wooden mouthpiece or beak, as in the clarinet, the basset-horn, etc.). A pipe-organ usually contains one or more sets of reed-pipes, the tongues of which are nearly always striking reeds of brass. (See *reed-pipe*.) A reed-organ is properly a collection of several sets of reeds, the tongues of which are free reeds of brass. (See *reed-organ*.) In the brass wind group of instruments, with but few exceptions, the tone is produced by the player's lips acting as free membranous reeds within the cup of the mouthpiece. The mechanism of the human voice, also, is essentially a reed-instrument, the vocal cords being simply free membranous reeds which may be stretched within the tube of the larynx. The quality of the tone produced by a reed varies indefinitely, according to the material and character of the reed itself, the method in which it is set in vibration, and especially the arrangement of the tube or cavity with which it is connected. The accompanying fig. 1 shows the construction of an organ-reed: *a* is the reed-block, which in use is inserted in its proper slot in the reed-board, *b*, the metal tongue, which is set in sonorous vibration when air is forced through the opening *c*. Fig. 2 shows the mouthpiece of a clarinet in which *a* is the reed, held to the body of the mouthpiece by the split-bands *b*, which are drawn tight by the screws *c*. Air entering between the reed and the margin of an opening which it covers causes it to produce a musical tone, the pitch of which is varied partly by the position of the mouthpiece in the mouth and partly by the action of the keys. Fig. 3 shows the mouthpiece of an oboe, and similar reeds are used for bassoons and bagpipes. The reed is made of two counterparts of the same shape bound together by the thread *a*. The lower and middle parts of the mouthpiece are circular in cross section, but the upper part *c*, the reed proper, is flattened. Air forced through this opening causes the reed to emit a harsh tone, which is softened in quality by the tube of the instrument. (*b*) In reed-instruments of the oboe class, and in both pipe- and reed-organs, the entire mechanism immediately surrounding the reed proper, consisting of the tube or box the opening or eschallot of which the reed itself covers or fills, together with any other attachments, like the tuning-wire of reed-pipes. (See *reed-organ* and *reed-pipe*.) In the clarinet the analogous part is called the *beak* or *mouthpiece*. (*c*) Any reed-instrument as a whole, like an oboe or a clarinet: as, the *reeds* of an orchestra. (*d*) In *organ-building*, same as *reed-stop*.—5. A missile weapon; an arrow or a javelin: used poetically.

6. Reeds or straw prepared for thatching; thatch: a general term: as, a bundle of *reed*.—7. A long slender elastic rod of whalebone, rattan, or steel, of which several are inserted in a woman's skirt to expand or stiffen it.—8. In *mining*, any hollow plant stem which can be filled with powder and put into the cavity left by the withdrawal of the needle, to set off the charge at the bottom. Such devices are nearly or entirely superseded by the safety-fuse. Also called *spire*.—9. An instrument used for pressing down the threads of the woof in tapestry, so as to keep the surface well together.—10. A weavers' instrument for separating the threads of the warp, and for beating the weft up to the web. It is made of parallel slips of metal or reed, called *dents*, which resemble the teeth of a comb. The dents are fixed at their ends into two parallel pieces of wood set a few inches apart.

The *reed* for weaving the same is measured in an equally complex manner, for the unit of length is 37 inches, and according to the number of hundreds of dents or splits it contains, so is the *reed* called. For instance, a "fourteen-hundred *reed*" means that 37 inches of a *reed* of that number, no matter what length, contains 1400 dents, or about 38 per inch. *A. Barlow*, Weaving, p. 329.

11. In *her.*, a bearing representing a weavers' *reed*. See *slay*2.—12. A Hebrew and Assyrian unit of length, equal to 6 cubits, generally taken as being from 124 to 130 inches.

The abundant down of the ripened spikes makes a poor material for stuffing pillows, etc., the leaves were formerly much used by coopers to prevent the joints of casks from leaking, and have been made into mats, chair-bottoms, etc. It is so named either directly from its reed like character and the resemblance of its head to a mace (club), or (*Prior*, "Popular Names of British Plants") from its being placed in the hands of Christ as a mace or scepter in pictures and in statues. Less properly called *bulrush*. In the United States known almost exclusively as *cattail* or *cattail flag*.

reed-motion (rēd′mō″shon), *n.* In *weaving*, the mechanism which, in power-looms, moves the batten, carrying the reed for beating up the weft between the threads of the warp. The term has also been inappropriately applied to a "stop motion" whereby, when the shuttle is trapped in its passage through the warp, the movement of the batten is stopped, to prevent breaking warp-threads by the impact of the reed against the shuttle. See *stop motion*.

reed-organ (rēd′or gan), *n.* A musical instrument consisting essentially of one or more graduated sets of small free reeds of metal, which are sounded by streams of air set in motion by a bellows, and controlled from a keyboard like that of the pianoforte. The two principal varieties are the *harmonium*, which is common in Europe, and the so-called *American organ*, the chief essential difference between which is that the former is sounded by a compression bellows driving the air outward through the reeds, and the latter by a suction bellows drawing it inward through them. The tone of the harmonium is usually keener and more nasal than that of the American organ. The apparatus for compressing or exhausting the air and for distributing the current among the various sets of reeds and among the channels belonging to the various digitals of the keyboard is not essentially different from that of a pipe organ, though on a much smaller scale. (See *organ*.) The bellows, however, is usually operated by means of alternating treadles. The keyboard is exactly similar to that of the pipe organ or the pianoforte, and has a compass of about four or five octaves. The tone-producing apparatus consists of one or more sets of small brass *vibrators*, or *reeds* (see illustration); the pitch of the tone depends on the size of their vibratile tongues, and its quality on their proportions and on the character of the resonating cavities with which they are connected. Each set of vibrators constitutes a *stop*, the use of which is controlled by a stop knob. The possible variety of qualities is rather limited. The treadle-operated feeders, which are connected with a general bellows, so that the current of air may be maintained at a constant tension; but in the harmonium the waste-valve of the bellows may be closed by drawing a stop knob called the *expression-stop*, so that the force of the tones may be directly varied by the rapidity of the treadling. In the American organ the force of the tones is varied by a lever, operated by the player's knee, which opens or closes a shutter in the box inclosing the vibrators. The harmonium sometimes has a mechanism called the *percussion*, providing a little hammer to strike the tongue of each reed as its digital is depressed, thus setting it into vibration very promptly. A *tremulant* is often introduced, consisting of a revolving fan, by which the current of air is made to oscillate slightly. More than one manual keyboard and a pedal keyboard, with separate stops for each, as in the pipe-organ, occur in large instruments. Occasionally a set of pipes is also added. Various devices for sustaining tones in the bass after the fingers have left the digitals, or for emphasizing the treble are sometimes introduced. Pianofortes are made with a harmonium attached (sometimes called an *aeolian attachment*). The reed-organ has become one of the commonest of musical instruments. Its popularity rests upon its capacity for concerted music, like the pianoforte and pipe-organ, combined with simplicity, portability, cheapness, and stability of intonation. Artistically regarded its tone is apt to be either weak and negative or harsh and unsympathetic. A variety of recent invention, the *vocalion*, has a remarkably powerful and mellow tone.

reed-pipe (rēd′pīp), *n.* In *organ-building*, a pipe whose tone is produced by the vibration of a reed or tongue: opposed to *flue-pipe*. Such pipes consist of a *foot* or *mouthpiece* containing the reed, and a tubular *body* furnishing a column of air for sympathetic vibration. The term *reed* is applied to both the vibratile tongue and the mechanism immediately surrounding it. In the latter sense, a reed consists of a metal tube connecting the *foot* and the *body* of the pipe; at its lower end is an oblong opening or eschallot, over or in which is fixed the brass tongue or reed proper. The effective length of the tongue is controlled by a movable spring or *tuning-wire*, the head of which projects outside the pipe-foot. The pitch of the tone depends primarily upon the vibrating length of the tongue, but is modified by the length of the air-column in the body of the pipe. A reed-pipe, therefore, is tuned both on the reed and on the top of the pipe. The quality of the tone depends somewhat on the form of the tongue, but chiefly on that of the body as a whole. The force of the tone depends on the pressure of the air-current, on the size of the inlet to the foot, and on the exact adjustment of the tongue to the eschallot. Most reed pipes have striking reeds, but free reeds are occasionally used. A set of reed-pipes is called a *reed stop*.

reed-pit (rēd′pit), *n.* [ME. *reede pytte*; < *reed*[1] + *pit*[1].] A fen. *Prompt. Parv.* (*Halliwell.*)

reed-stop (red′stop), *n.* In *organ-building*, a set or register of reed-pipes the use of which is controlled by a single stop-knob: opposed to *flue-stop*. Each partial organ usually has one or more such stops, though they are less invariable in the pedal organ than in the others. They are generally intended to imitate some orchestral instrument, as the *trumpet* (usually placed in the great organ), the *oboe* (usually in the swell organ), the *clarinet* (usually in the choir organ), the *trombone* (usually in the pedal organ), the *cornopean*, the *clarion*, the *contrafagotto*, etc. They may be of eight-feet, four-feet, or sixteen-feet tone. (See *organ*[1].) Reed-stops are specially valuable because of their powerful, incisive, and individual quality, which is suited both for solo effects and for the enrichment of all kinds of combinations. The most peculiar reed stop is the *vox humana*. A reed stop is often called simply a *reed*.

Another species, *A. turdoides*, is known as the *greater reed warbler*, *reed-thrush*, and *reed-wren*.

An American wren of the family *Troglodytidæ* and genus *Thryothorus*, as the great Carolina wren, *T. carolinensis*, or Bewick's wren, *T. bewicki*. reef[1] (rēf), *n.* [Formerly *ryff*; < D. *rif* = MLG. *rif*, *ref*, LG. *riff*, *reff* (> G. *riff*), a reef, = Icel. *rif* = Dan. *rev*, a reef, sand-bank; akin to Icel. *rifa*, a fissure, rift, rent, = Sw. *refva*, a strip, cleft, gap; Sw. *refvel*, a sand-bank, = Dan. *revle*, a sand-bank, bar, shoal, a strip of land, a lath; prob. from the verb, Icel. *rifa*, etc., rive, split: see *rive*[1]. Cf. *riff*[1].] 1. A low, narrow ridge of rocks, rising ordinarily but a few feet above the water. A reef passes by increase of size into an island. The word is especially used with reference to those low islands which are formed of coralline debris. See *atoll*, and *coral reef*, below.

Atolls have been formed during the sinking of the land by the upward growth of the *reefs* which primarily fringed the shores of ordinary islands.

Coral reef, an accumulation of calcareous material which has been secreted from the water of the tropical ocean, and especially of the Pacific to the south of the equator, by the reef-building corals. Such accumulations, which are often of great dimensions, offer curious peculiarities of formation and distribution. They have been classified under the names of *fringing* and *barrier reefs* and *atolls*. *Fringing reefs* border the land; *barrier reefs* extend parallel with but at some distance from the shore; *atolls* are approximately circular or elliptical in form, and typical atolls inclose a lagoon, which usually communicates with the ocean by one or more passages through the reef. Barrier reefs may be hundreds of miles in length, that off the shore of Australia is 1,250 miles long, and from 10 to 90 broad. Atolls vary from 1 to 50 miles and over in diameter. The principal mass of a coral reef consists essentially of dead coral, together with more or less of the skeletons and shells of other marine organisms, this dead material is mingled with debris resulting from the action of breakers and currents on the coralline formation. The exterior of such a reef, where conditions are favorable to the development of the coral animals, especially on its seaward face, is covered with a layer or mantle of living and growing coral and the rapidity and vigor of this growth depend on the supply of food brought by the oceanic currents. Where the conditions for this supply have not been favorable, there the reefs are not found, where the conditions have been such as to encourage growth, but have ceased to have this character, there the formation of the reef has slackened or been stopped altogether. Investigations have shown that the reef-building corals cannot flourish where the temperature of the surface-water sinks below 70°, in the typical coral regions the temperature is decidedly higher than that and its range very small. Neither can the reef builders work at a considerable depth, or above the level of low tide, their entire vertical range is not more than 15 or 20 fathoms at the utmost. These conditions of coral-reef formation, coupled with the fact that the carbonate of lime in the form in which it has been left by the death of the organisms by which it was secreted is decidedly soluble in sea-water, are sufficient to account for all the peculiarities in the distribution and mode of occurrence of these remarkable structures. It is because the currents sweeping toward the eastern shores of the continents are warm and constant that, while the western sides of Africa and South America exhibit only isolated patches of coral, the eastern borders are abundantly supplied with it. It is not now considered necessary to call in the assistance of a general subsidence of the Pacific Ocean bottom in order to account for the form of the atolls, for it is the opinion of most of the recent investigators that all the characteristic features of the coral formations — whether these occur as fringing or barrier reefs, or as atolls — can be produced in regions of subsidence or of elevation, as well as in those where no change of level is taking place.

reef[2] (rēf), *n.* [Formerly *riff*; < ME. *riff*, < MD. *rif* (also *rift*), D. *reef* = LG. *reff*, *riff* (> G. *reef*, *reff*) = Icel. *rif* = Sw. *ref* = Dan. *rev*, a reef of a sail; of uncertain origin; perhaps of like origin with *reef*[1]. In topsails and courses, and sometimes in topgallantsails, the reef is the part of the sail between the head and the first reef band, or between any two reef-bands; in fore-and-aft sails reefs are taken on the foot. There are generally three or four reefs in topsails, and one or two in courses.

In square sails the reef points are tied round the yard as well as the sail, in fore-and-aft sails they may or may not be tied round the boom which extends the foot of the sail. In very large ships, where the yards are so large as to make it inconvenient to tie the reef-points around them, the sails are sometimes reefed to jackstays on the yards.

Up, aloft, lads! Come, *reef* both topsails!
Davenant and Dryden, Tempest, i. 1.

The bowsprits on cutters can be *reefed* by being drawn closer in and fidded. *Yachtman's Guide.*

II. *intrans.* See the quotation. [Colloq.]

In some subtle way, however, when the driver moves the bit to and fro in his mouth, the effect is to enliven and stimulate the horse, as if something of the jockey's spirit were thus conveyed to his mind. The salmon-reel is about four inches, and the trout-reel about two inches in diameter; the length is about two inches. In angling the reel plays an important part, its use and action requiring to be in perfect accord or correspondence with the play of the rod and line. To meet these requirements, clicks and multipliers are employed. The click checks the line from running out too freely, and the multiplier gathers in the slack with increased speed. (*n*) A hose carriage.—**Off the reel**, one after another without a break; in uninterrupted succession: as, to win three games *off the reel*. 2. In *metal.*, to bring into a condition of purity as complete as the nature of the ore treated will allow. Used chiefly with reference to gold and silver, especially with reference to the separation (parting) of these two metals from each other and from the baser metals with which they are combined in what are known as bullion-bars or bricks of mixed metals, as they come from the mills located at or near the mines. Refining is in general, the last stage or stages in the metallurgical treatment of an ore. As the term *refining* is commonly used with reference to the manufacture of iron, it means the partial decarburization and purification of pig in the open-hearth furnace, for the purpose of rendering it more suitable for use in the puddling-furnace in which the process of converting it into malleable iron is completed. This method of puddling is called *dry puddling*. The operation of converting pig- into wrought-iron in the open-hearth furnace, when begun and completed without puddling, is generally called *fining*, and in this process charcoal or coke is used. There are many modifications of the fining process, but the principle is the same in all. In puddling, raw coal is used, and the fuel does not come in contact with the metal; in fining, the ore and fuel (either charcoal or coke) are together upon the same hearth. The various fining processes for converting pig- into wrought-iron, with charcoal as fuel, were of great importance before the invention of puddling, by which method much the larger part of the wrought-iron now used in the world is prepared, and this is done, for the most part, without previous partial decarburization of the pig in the refinery, by the process known as *wet puddling*, or *pig-boiling*. See *puddle*[1] and *finery*[2].

2. The act of reflecting, or the state of being reflected; specifically, in *physics*, the change of direction which a ray of light, radiant heat, or sound experiences when it strikes upon a surface and is thrown back into the same medium from which it approached. Reflection follows two laws, viz.—(1) the angle of reflection is equal to the angle of incidence; and (2) the reflected and incident rays are in the same plane with a normal to the surface. If DE represents the surface of a mirror and CB the incident ray, then HBC is the *angle of incidence*, and HBA, equal to it, is the *angle of reflection*. This applies alike to sound, to radiant energy (heat and light), and also to a perfectly elastic body bounding from a perfectly elastic rigid surface. The plane passing through the perpendicular to the reflecting surface at the point of incidence and the path of the reflected ray of light or heat is called the *plane of reflection*. (See *mirror*, *echo*.) For the total reflection of rays when the critical angle is passed, see *refraction*.

7. A kind of self-consciousness resulting from an outward perception, whether directly or indirectly; the exercise of the internal sense; the perception of a modification of consciousness; the faculty of distinguishing between a datum of sense and a product of reason; the consideration of the limitations of knowledge, ignorance, and error, and of other unsatisfactory states as leading to knowledge of self; the discrimination between the subjective and objective aspects of feelings. The Latin word *reflexio* was first used as a term of psychology by Thomas Aquinas, who seems to intend no optical metaphor, but to conceive that consciousness is turned back upon itself by the reaction of the object of outward perception. According to Aquinas, pure thought in itself can know nothing of singulars, or particular things; but in perception there is a peculiar sense of reaction or reciprocation which he calls *reflection*, and this first makes us aware of the existence of actual singulars and also of thought as being an action; and this, according to him, is the first self-consciousness. Scotus accepted reflection, not as affording the first knowledge of singulars, but as a perception of what passes in the mind, and thus the original meaning of the term was modified. Walter Burleigh, who died in 1337, affords an illustration of this when he says that the thing without is apprehended before the passion which is in the soul, because the thing without is apprehended directly, and the passion of the soul only indirectly, by reflection. Ramus, in his dissertation on reflection, defines it as "the successive direction of the attention to several partial perceptions." A still further change of meaning had come about when Goclenius, in 1613, defined reflection as "the inward action of the soul, by which it recognizes both itself and its acts and ideas." The importance of the word in the English school of philosophy (Berkeley, Hume, etc.) may be said to be due entirely to its use by Locke, who explains it as follows:

The other fountain from which experience furnisheth the understanding with ideas is the perception of the operations of our own mind within us, as it is employed about the ideas it has got; which operations, when the soul comes to reflect on and consider, do furnish the understanding with another set of ideas, which could not be had from things without; and such are perception, thinking, doubting, believing, reasoning, knowing, willing, and all the different actings of our own minds; which we being conscious of, and observing in ourselves, do from these receive into our understandings as distinct ideas as we do from bodies affecting our senses. This source of ideas every man has wholly in himself; and though it be not sense, as having nothing to do with external objects, yet it is very like it, and might properly enough be called internal sense. But as I call the other sensation, so I call this *reflection*, the ideas it affords being such only as the mind gets by reflecting on its own operations within itself. By *reflection*, then, in the following part of this discourse, I would be understood to mean that notice which the mind takes of its own operations, and the manner of them; by reason whereof there come to be ideas of these operations in the understanding.
Locke, Human Understanding, II. i. 4.

Reid endeavored to revive the Ramist use of the word, for which he is condemned by Hamilton. Kant, in his use of the term, returns to something like the Thomist view, for he makes it a mode of consciousness by which we are made aware whether knowledge is sensuous or not. Kant makes use of the term *reflection* to denote a mode of consciousness in which we distinguish between the relations of concepts and the corresponding relations of the objects of the concepts. Thus, two concepts may be different, and yet it may be conceived that their objects are identical; or two concepts may be identical, and yet it may be conceived that their objects (say, two drops of water) are different. Mr. Shadworth Hodgson, in his "Philosophy of Reflection," 1878, uses the term to denote one of three fundamental modes of consciousness, namely that in which the objective and subjective aspects of what is present are discriminated without being separated as person and thing.

The faculty by which I place the comparison of representations in general by the side of the faculty to which they belong, and by which I determine whether they are compared with each other as belonging to the pure understanding or to sensuous intuition, I call transcendental *reflection*.
Kant, Critique of Pure Reason, tr. by Muller, p. 261.

The particular *reflection* that states of consciousness are things, or that the Subject is its Objects, constitutes . . . the reflective mode of consciousness. . . . Perception . . . is the rudimentary function in *reflection* as well as in primary consciousness; and reflective conception is a derivative from it. *S. Hodgson*, Philosophy of Reflection, i. 2, § 3.

3. That which reflects. Specifically: (*a*) A polished surface of metal or any other suitable material, used for the purpose of reflecting rays of light, heat, or sound in any required direction. Reflectors may be either plane or curvilinear; of the former the common mirror is a familiar example. Curvilinear reflectors admit of a great variety of forms, according to the purposes for which they are employed; they may be either convex or concave, spherical, elliptical, parabolic, or hyperbolic, etc. The parabolic form is perhaps the most generally serviceable, being used for many purposes of illumination as well as for various highly important philosophical instruments. Its property is to reflect, in parallel lines, all rays diverging from the focus of the parabola, and conversely. A series of parabolic mirrors, by which the rays from one or more lamps were reflected in a parallel beam, so as to render the light visible at a great distance, was the arrangement generally employed in lighthouses previous to the invention of the Fresnel lamp, or dioptric light. The annexed cut is a section of a ship's lantern fitted with an Argand lamp and parabolic reflector. *a a* is the reflector, *b* the lamp, situated in the focus of the polished concave parabolole, *c* the oil-cistern, *d* the outer frame of the lantern, and *e* the chimney for the escape of the products of combustion. (*b*) A reflecting telescope, the speculum of which is an example of the converse application of the parabolic reflector, the parallel rays proceeding from a distant body being in this case concentrated into the focus of the reflector. Ballot reform, reform in the manner of voting in popular elections. Since about 1887 several of the United States have passed laws designed to promote secrecy in voting, to discourage corruption at elections, and to provide for an exclusively official ballot; these laws are modeled more or less on the so-called Australian system in elections. — **Civil-service reform**, in *U. S. politics*, reform in the administration of the civil service of the United States; more generally, reform in the administration of the entire public service, federal, State, and local. Since the passage of the Civil-service Act in 1871 this reform has been one of the leading questions for public discussion. See *Civil service Act* (under *civil*) and *spoils system* (under *spoil*). **Reform Act.** See *Reform Bill*. **Reform Bill**, specifically, in *Eng. hist.*, a bill for the purpose of enlarging the number of voters in elections for members of the House of Commons, and of removing inequalities in representation. The first of these bills, passed in 1832 by the Liberals after a violent struggle, and often called specifically The Reform Bill, disfranchised many rotten boroughs, gave increased representation to the large towns, and enlarged the number of the holders of county and borough franchise. The effect of the second Reform Bill, passed by the Conservatives in 1867, was in the direction of a more democratic representation, and the same tendency was further shown in the Franchise Bill (see *franchise*) passed by the Liberals in 1884. — **Reform school**, a reformatory. Specifically, with the definite article — **3.** [*cap.*] The great religious revolution in the sixteenth century, which led to the establishment of the Protestant churches. The Reformation assumed different aspects and resulted in alterations of discipline or doctrine more or less fundamental in different countries and in different stages of its progress. Various reformers of great influence, as Wyclif and Huss, had appeared before the sixteenth century but the Reformation proper began nearly simultaneously in Germany under the lead of Luther and in Switzerland under the lead of Zwingli. The chief points urged by the Reformers were the need of justification by faith, the use and authority of the Scriptures and the right of private judgment in their interpretation, and the abandonment of the doctrine of transubstantiation, the adoration of the Virgin Mary and saints, the supremacy of the Pope, and various other doctrines and rites regarded by the Reformers as unscriptural. In the German Reformation the leading features were the publication at Wittenberg of Luther's ninety-five theses against indulgences in 1517, the excommunication of Luther in 1520, his testimony before the Diet of Worms in 1521, the spread of the principles in many of the German states, as Hesse Saxony, and Brandenburg, and the opposition to them by the emperor, the Diet and Confession of Augsburg in 1530, and the prolonged struggle between the Protestants and the Catholics, ending with comparative religious equality in the Peace of Passau in 1552. The Reformation spread in Switzerland under Zwingli and Calvin, in France Hungary, Bohemia, the Scandinavian countries, Low Countries, etc. In Scotland it was introduced by Knox about 1560. In England it led in the reign of Henry VIII. to the abolition of the papal supremacy and the liberation from papal control of the Church of England, which, after a short Roman Catholic reaction under Mary, was firmly established under Elizabeth. In many countries the Reformation occasioned an increased strength and zeal in the Roman Catholic Church sometimes called the *Counter-Reformation*. The term *Reformation* as applied to this movement is not of course accepted by Roman Catholics, who use it only with some word of qualification.

Prophesies and Forewarnings . . . sent before of God, by divers and sundry good men, long before the time of Luther, which foretold and prophesied of this *Reformation* of the Church to come. *Foxe*, Martyrs (ed. 1684), II. 43.

In France the Reformed were known as Huguenots. In the Netherlands the Arminians afterward separated from the Calvinists (Gomarists). In Germany, after 1817, the greater part of the Reformed and Lutherans combined to form the United Evangelical Church. Specifically – (*b*) In the United States. (1) The Reformed (Dutch) Church in America, growing out of a union among the Dutch churches in America in 1770 and finally perfected in 1812. The territory of the denomination was at first limited to the States of New York and New Jersey and a small part of Pennsylvania, but was gradually extended to the West. The affairs of each congregation are managed by a consistory, consisting of elders and deacons chosen for two years. The elders, with the pastor, receive and dismiss members and exercise discipline; the deacons have charge of the alms. Both together are ex officio trustees of the church, hold its property, and call its minister. Ex elders and ex deacons constitute what is called the Great Consistory, which may be summoned to give advice in important matters. The minister and one elder from each congregation in a certain district constitute a classis, which supervises spiritual concerns in that district. Four ministers and four elders from each classis in a larger district make a Particular Synod, with similar powers. Representatives, clerical and lay, from each classis, proportioned in number to the size of the classis, constitute the General Synod, which has supervision of the whole, and is a court of last resort in judicial cases. The church is Calvinistic in its theological belief, and possesses a liturgy the greater part of which is optional except the offices for the sacraments, for ordination, and for church discipline. (2) The Reformed (German) Church in the United States. This church was constituted by colonies from Germany in New York, Maryland, Virginia, and North and South Carolina. The first synod was organized September 27th, 1747, under the care of the Reformed Classis of Amsterdam. The church holds to the purity of the ministry, maintains a presbyterial form of government, is moderately Calvinistic in its theology, and provides liturgical forms of service, which are, however, chiefly optional. (3) The True Reformed Dutch Church, the result of a secession from the Reformed Dutch Church in America in 1822. (4) The Reformed Episcopal Church, an Episcopal church organized in the United States in 1873, by eight clergymen and twenty laymen previously members of the Protestant Episcopal Church. It maintains the episcopacy as a desirable form of church polity, but not as of divine obligation, continues to use the Book of Common Prayer, but in a revised form, and rejects the doctrines of apostolic succession, the priesthood of the clergy, the sacrifice or oblation in the Lord's Supper, the real presence, and baptismal regeneration. **Reformed officer,** in the British army, one who is continued on full pay or half-pay after his troops are broken up. *Farrow, Mil. Encyc.* – **Reformed Presbyterian Church,** a Presbyterian denomination originating in Scotland. See *Cameronian, n.*, 1, and *Covenanter*, 2. – **Reformed procedure.** See *equity*, 2 (*b*). – **The Reformed,** on the continent of Europe, Calvinistic Protestants as distinguished from Lutherans.

refraction (rē-frak'shon), *n.* [< OF. *refraction*, F. *réfraction* = Sp. *refraccion* = Pg. *refracção* = It. *rifrazione*, *refrazione*, < ML. *refractio*(*n*-), lit. a breaking up (in logic tr. Gr. *ἀνάκλασις*), NL. refraction, < L. *refringere*, pp. *refractus*, break up, break open, break to pieces: see *refract*.] 1. The act of refracting, or the state of being refracted: almost exclusively restricted to physics, and applied to a deflection or change of direction of rays, as of light, heat, or sound, which are obliquely incident upon and pass through a smooth surface bounding two media not homogeneous, as air and water, or of rays which traverse a medium the density of which is not uniform, as the atmosphere. It is found (1) that, when passing into a denser isotropic medium, the ray is refracted toward the perpendicular to the surface, and bent away from it when passing into one less dense; (2) that the sines of the angles of incidence and refraction bear a constant ratio to each other for any two given media; and (3) that the incident ray and the refracted ray are in the same plane. Thus, if (fig. 1) SP represents a ray incident upon the surface of water at P, it will be bent away from its original direction SPI, toward the perpendicular Qq in passing into the denser medium, and make an angle *q*PR, such that the $\frac{\sin SPQ}{\sin RPq}$ is a constant quantity – that is, the perpendicular distance of a point *q* (such that the line from it to P, the point of incidence, is normal to the surface) from the refracted path bears a constant ratio to its distance from the path as it would be without refraction, however the angle of incidence varies; but this constant depends on the nature of the two media. If the first medium is air, this constant ratio is called the *index of refraction* or *refractive index* of the given substance (or *n*). Again, if the ray proceeded from R to P, it would be bent away from the perpendicular in the direction PS. The latter case is peculiar, however, in that for a certain angle of incidence called the critical angle (whose sine = 1/*n*) the angle of refraction of QPS is a right angle and a ray incident at P at any greater angle cannot pass out into the rarer medium at all, but suffers total reflection at P. In fig. 2, AHC is the angle of incidence, and EHK the angle of refraction, CD being the normal to the surface; if, further, the second surface is parallel to the first, the ray emerging into the original medium at E has a direction EF parallel with its first direction, AH. If (fig. 3) the refracting medium has the form of a prism ABC, the incident ray LF suffers a double change of direction, first (FE) in passing into the prism, and second (EG) in emerging from it; the total angle of deviation IDI varies in value with a change in the direction of LF, but has a definite minimum value when the angles of incidence and emergence are equal. If *d* represents the angle of the prism BAC, and *r* the angle of minimum deviation, LDI, then the refractive index *n* of the material of which the prism is made is given by the relation $n = \frac{\sin \frac{1}{2}(d + r)}{\sin \frac{1}{2} d}$. The angle of deviation or refraction also increases as the wave-length of the ray diminishes, and hence a beam of white light in passing through a prism is both refracted and dispersed thus yielding a spectrum. The phenomena of the refraction of light explain the properties of lenses (see *lens*) and of prisms (see *prism* and *spectrum*). Sound-waves may also be refracted when passing from one medium to another of different density, obeying the same laws as light. *Double refraction* is the separation of a ray of light into two rays, which are unequally refracted upon passing through an anisotropic medium. This property belongs to all transparent crystalline substances except those of the isometric system. A striking example is calcite, hence called *doubly refracting spar*. In uniaxial crystals (those belonging to the tetragonal and hexagonal systems) one of the rays follows the ordinary law of refraction (see law (2), above), and is called the *ordinary ray;* the other, which does not, is called the *extraordinary ray;* both rays are polarized (see *polarization*), the ordinary ray having vibrations perpendicular to and the extraordinary ray vibrations parallel to the vertical axis. If the index of refraction is greater for the ordinary ray than for the extraordinary ray, the crystal is said to be *negative*, and in the opposite case *positive*: otherwise expressed, a crystal is negative or positive according as the crystallographic axis (optical axis) is the axis of greatest or of least elasticity. In the direction of the vertical axis a ray suffers no double refraction, and this direction is called the *optic axis*. In biaxial crystals (those belonging to the orthorhombic, monoclinic, and triclinic systems) neither ray follows the ordinary law of refraction, and there are two directions, called *optic axes*, lying in the plane of the axes of greatest and least elasticity, in which a ray suffers no double refraction. There are also three indices of refraction, corresponding to the rays propagated by vibrations parallel to the three axes of elasticity. A biaxial crystal is called *negative* or *positive* according as the acute bisectrix coincides with the axis of greatest or of least elasticity. According to the degree of difference between the two indices of refraction of a uniaxial crystal and between the greatest and least of the three indices of a biaxial crystal, the double refraction is said to be *strong* or *weak;* upon this difference depends the brilliancy of color of thin sections of a crystal as seen in polarized light. Amorphous substances like glass do not show double refraction, except under abnormal conditions, as when subjected to unequal strains, as in glass suddenly cooled. This is also true of crystals belonging to the isometric system, which, however, sometimes show secondary or abnormal double refraction (as garnet), due to internal molecular strain or other cause. For the refraction of the eye, see *eye*[1], and *crystalline humor* (under *crystalline*). Errors of refraction in the eye are tested by trial with lenses, test types, etc., by the ophthalmoscope, or by skiascopy or the shadow-test, and are corrected by appropriate glasses.

2. In *logic*, the relation of the Theophrastian moods to the direct moods of the first figure.—**Astronomical or atmospheric refraction**, the apparent angular elevation of the heavenly bodies above their true places, caused by the refraction of the rays of light in their passage through the earth's atmosphere, so that in consequence of this refraction those bodies appear higher than they really are. It is greatest when the body is on the horizon, and diminishes all the way to the zenith, where it is zero.—**Axis of double refraction.** See *optic axis* (*b*), under *optic*.—**Axis of refraction.** See *axis*[1].—**Caustic by refraction.** See *diacaustic*.—**Conical refraction**, the refraction of a single ray of light, under certain conditions, into an infinite number of rays in the form of a hollow luminous cone, consisting of two kinds, *external conical refraction* and *internal conical refraction*, the ray in the former case issuing from the refracting crystal as a cone with its vertex at the point of emergence, and in the latter being converted into a cone on entering the crystal, and issuing as a hollow cylinder.—**Double refraction.** See def. 1.—**Dynamic refraction**, refraction of the eye as increased in accommodation.—**Electrical double refraction**, the double refraction produced in an isotropic dielectric medium, as glass, under the action of an electrical strain.—**Index of refraction.** See *index*, and def. 1.—**Plane of refraction**, the plane passing through the normal or perpendicular to the refracting surface at the point of incidence and the refracted ray.—**Point of refraction.** See *point*[1].—**Refraction equivalent**, a phrase used by Landolt to express in the case of a liquid the quantity obtained by multiplying the molecular weight of the liquid by the so-called specific refractive energy, as defined by Gladstone and Dale (namely, the refractive index less unity divided by its density referred to water). The refraction equivalent of a compound is said to be equal to the sum of the equivalents of its component parts.—**Refraction of altitude and declination, of ascension and descension, of latitude and longitude**, the change in the altitude, declination, etc., of a heavenly body due to the effect of atmospheric refraction.—**Refraction of sound**, the bending of a beam of sound from its rectilinear course whenever it undergoes an unequal acceleration or retardation, necessarily turning toward the side of least velocity and from the side of greatest velocity.—**Static refraction**, refraction of the eye when the accommodation is entirely relaxed.—**Terrestrial refraction**, that refraction which makes terrestrial objects appear to be raised higher than they are in reality. This arises from the air being denser near the surface of the earth than it is at higher elevations, its refractive power increasing as the density increases. The mirage is a phenomenon of terrestrial refraction.

Many forms of this have been devised; and the term is specifically applied to an instrument which employs interference-fringes and which allows of the measurement of the difference of path of two interfering rays—the immediate object of observation being the displacement produced by the passage of the ray through a known thickness of the given medium, from which its refractive power can be found. Such refractometers (*interential refractometers*) may also be employed for other purposes, for example, in certain cases of linear measurement.

refrigerating-chamber (rē-frij'ė-rā-ting-chām'bėr), *n.* A chamber in which the air is artificially cooled, used especially for the storage of perishable provisions during warm weather.

refrigerating-machine (rē-frij'ė-rā-ting-ma-shēn'), *n.* A machine for the artificial production of cold. In such machines mechanical power is employed for the conversion of heat into work by operating upon a gas at a temperature far removed from that at which such gas becomes a liquid. They perform the following cycle of operations: first, the gas is compressed into a smaller volume, in which compression its contained heat is increased by the heat-equivalent of the work performed in the compression; secondly, the compressed gas is cooled under constant pressure, and thus brought near to the temperature of the cooling medium (usually water), and the increase of heat due to compression is removed; thirdly, the compressed and cooled gas is permitted to expand, expending a portion of its expansive force in the performance of work. This work having been performed at the expense of the store of heat originally contained in the gas, the latter has now lost the heat-equivalent of the work, and its temperature is greatly lowered. The now cold gas can be used for the refrigeration of any other substance which has a higher temperature by methods described under *ice-machine* and *refrigeration*. In other machines a gas or vapor the ordinary temperature of which is near to that at which it liquefies is compressed and cooled, and subsequently permitted to assume the gaseous form. By the compression the temperature of liquefaction is raised till it becomes the same as or a little higher than that of a conveniently available cooling medium, such as ordinary atmospheric air, or, most commonly, water at ordinary temperature, the application of which to cooling the gas still under constant pressure reduces it to the liquid state, or to a state of intermixed liquid and gas. The subsequent expansion of the liquid into gas is performed at the expense of its inner heat. It therefore suffers a reduction of temperature, to restore which it absorbs its latent heat of vaporization from a surrounding or contiguous substance (usually a saline solution), which, thus made cold, is used for cooling air-spaces, or refrigerators or substances therein contained, or for making ice. Machines of either of the above classes are very commonly called *ice-machines*, and are so styled in the classifications of Inventions in both the United States and British patent-offices, whether designed for the manufacture of ice, for merely cooling substances in insulated spaces or refrigerators, or for both these purposes.

refrigeration (rē-frij-ė-rā'shon), *n.* [< OF. *refrigeration*, F. *réfrigération* = Sp. *refrigeracion* = Pg. *refrigeração* = It. *refrigerazione*, < L. *refrigeratio(n-)*, a cooling, coolness, mitigation (of diseases), < *refrigerare*, pp. *refrigeratus*, make cool again: see *refrigerate*.] 1. The act of refrigerating or cooling; the abatement of heat; the state of being cooled.

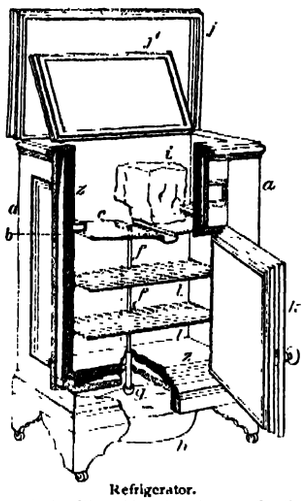
The testimony of geological evidence . . . indicates a general *refrigeration* of climate.
Croll, Climate and Time, p. 530.



Specifically—2. The operation of cooling various substances by artificial processes. This is effected by the use of inclosures in which the articles to be cooled are placed on or in proximity to ice or other refrigerating substances or freezing-mixtures, or in air cooled by a refrigerating-machine or -apparatus; or, as in beer-cooling, by floating metallic pans or vessels containing ice upon the surface of the liquid to be cooled, or by circulating the latter over an extended surface of some good conductor of heat cooled by continuous contact of cold water, cold air, or cold brine with the opposite surface. See *ice-machine* and *refrigerating machine*. — **Chemical refrigeration**, refrigeration by the use of mixtures of substances which, during their admixture, by mutual solution of each in the other, or the solution of one or more in another or others, become lowered in temperature by absorption of the latent heat of liquefaction from the sensible heat. Remarkable changes of temperature are thus produced by a variety of refrigerating mixtures or freezing-mixtures. See *freezing-mixture*. — **Mechanical refrigeration.** (*a*) In its strictest sense, the conversion of heat into work by the expansion of a volume of gas or vapor which performs work during the act of expansion, as in moving a piston against some resistance, usually that of a pump or compressor for compressing another volume of such gas or vapor. The gas during the expansion, if it expands adiabatically, is reduced in temperature by the conversion of its inner heat into work, the reduction being found in degrees by dividing the work due to the expansion by the product of the specific heat of the gas, the weight of the volume expanded, and the mechanical equivalent of heat. Air mechanically refrigerated is frequently discharged directly into refrigerators or rooms it is desired to cool, but in apparatus for cooling by the use of other gases and vapors a strong solution of some salt which resists freezing at low temperatures — as sodium, calcium, or magnesium chlorid — is used as a medium for extracting heat from the substances and spaces to be cooled, and as a vehicle for conveying the heat so abstracted to the mechanically cooled gas. See *ice-machine*. (*b*) In a broader sense, a process of refrigeration in which the cycle of heat-changes is only partly produced by mechanical action, as in compression ice-machines using anhydrous ammonia, wherein the cooling of the vapor takes place entirely during the formation from the liquid, and is caused by absorption of the latent heat of vaporization from the sensible heat of the substance, the mechanical part of the process being wholly confined to compressing the ammonia-vapor while liquefying it under the action of cold and pressure. Such machines are the most effective and the most extensively used.

Domestic refrigerators are made in a great variety of shapes, and may be either portable or built into the walls of a house. They range from the common ice-box (which in its simplest form is merely a metal-lined wooden box with facilities for drainage, kept partly filled with ice on which fish or meat may be kept) to large and elaborate ice chests and ice rooms. These rights were exercised by the Norman and Plantagenet kings of England and by the French kings from the eleventh century onward with constantly widening application and increased insistence till the time of Louis XIV. The act of regenerating or producing anew.—2. In *theol.*: (*a*) A radical change in the spirit of an individual, accomplished by the direct action of the Spirit of God. Evangelical theologians agree that there is a necessity for such a radical spiritual change in man in order to the divine life; but they differ widely in their psychological explanations of the change. They are, however, generally agreed that it consists of or at least necessarily involves a change in the affections and desires of the soul. Regeneration is also understood, as by the Roman Catholic Church, to be the gift of the germ of a spiritual life conferred regularly by God's ordinance in baptism, which is accordingly called the *sacrament of regeneration*, or simply *regeneration*. The word *regeneration* occurs only once in the New Testament in its ordinary theological meaning; but equivalent expressions are found, such as "begotten again," "born again," "born of God," "born of water and of the Spirit."

> According to his mercy he saved us, by the washing of *regeneration*, and renewing of the Holy Ghost. Tit. iii. 5.

3 (rē-jen-ę-rā'shon). In *biol.*, the genesis or origination of new tissue to repair the waste of the body, or to replace worn-out tissue; also, the reproduction of lost or destroyed parts or organs. Regeneration of tissue constantly goes on in all animals in the ordinary repair of waste products of vital action; but the replacing of lost parts, as a limb, is nearly confined to animals below vertebrates, in many of which it is an easy or usual process.—**Baptismal regeneration**. See *baptismal*.=**Syn. 2.** See *conversion*.—3. See *reproduction*.

2. In *metal.*, a chamber filled with a checker-work of fire-bricks; that part of a regenerative furnace in which the waste heat of the gases escaping from the hearth is, by reversal of the draft at suitable intervals, alternately stored up and given out to the gas and air entering the furnace. The idea of employing what is now generally called the "regenerative system" of heating was first conceived by Robert Stirling, in 1816, but his arrangement for carrying it out was not a practical one. The present form of the furnace, and in general the successful application of the principle, constituting a highly important improvement in the consumption of fuel, are due to the brothers Siemens. The regenerative system has already been extensively applied in various metallurgical and manufacturing processes, and is likely to receive still further development. According to the Siemens regenerative method, there must be at least one pair of regenerative chambers, in order that the heat may be in process of being stored up in one while being utilized in the other. In the Siemens regenerative reheating- or mill-furnace there are two pairs of chambers, each pair consisting of one larger and one smaller chamber, through one of which the air passes, and through the other the gas on its way to the furnace. The so-called "Ponsard recuperator" is a form of regenerator in which, by an ingenious arrangement of solid and hollow fire-bricks, the current is made continuous in one direction, instead of requiring reversal as in the Siemens regenerative furnace. This form of furnace has been employed for reheating in rolling-mills.

At Cambridge all resident masters of arts of less than four years' standing, and all doctors of less than two, are regents. At Oxford the period of regency is shorter. At both universities those of a more advanced standing, who keep their names on the college books, are called *non-regents*. At Cambridge the regents compose the upper house and the non-regents the lower house of the senate, or governing body. At Oxford the regents compose the congregation, which confers degrees and does the ordinary business of the university. The regents and non-regents collectively compose the convocation, which is the governing body in the last resort.

The regents have power to incorporate, and to alter or repeal the charters of colleges, academies, libraries, museums, or other educational institutions belonging to the University; to distribute to them all funds granted by the state for their use; to inspect their workings and require annual reports under oath of their presiding officers; to establish examinations as to attainments in learning, and confer on successful candidates suitable certificates, diplomas, and degrees, and to confer honorary degrees."—**House of regents**. It is the largest permanent association of soldiers, and the third subdivision of an army-corps, several regiments constituting a brigade, and several brigades a division. These combinations are, however, temporary, while in the regiment the same officers serve continuously, and in command of the same bodies of men. The strength of a regiment may vary greatly, as any regiment may comprise any number of battalions. The organization of the British Royal Artillery is anomalous, the whole body forming one regiment. It consists of about 33,000 officers and men, distributed in a number of brigades, each of which is as large as an ordinary regiment. In the United States service the full strength of a cavalry regiment is now 821, and of infantry 821. Abbreviated *regt*.

7. In *zoögeog.*, a large faunal area variously limited by different authors. Especially - (*a*) A realm; one of several primary divisions of the earth's surface, characterized by its fauna: as, the Palearctic or the Nearctic *region*. The term acquired specific application to certain large principal areas from its use in this sense by P. L. Sclater in 1857. Sclater's regions, adopted with little modification by Günther and Wallace, were six in number: the Palearctic, Ethiopian, Oriental or Indian, Australian, Nearctic, and Neotropical. (See these words.) Baird added a seventh, the West Indian, now considered a division of the Neotropical. In 1874 Sclater, following Huxley, recognized as primary divisions (1) *Arctogæa*, comprising the Palearctic, Ethiopian, Indian, and Nearctic regions; (2) *Dendrogæa*, represented by the Neotropical region; (3) *Antarctogæa*, with an Australasian region; and (4) *Ornithogæa*, with a New Zealand region. (*b*) A secondary faunal area, the primary being called a *realm*: as, the Antillean, Central American, and Brazilian *regions* of the American Tropical realm. In this sense it has been used by most American zoologists. Various other divisions have been proposed, as by A. Murray in 1866, Huxley in 1868, W. T. Blanford in 1869, E. Blyth in 1871, A. Newton in 1875, T. Gill in 1878, and J. A. Allen in 1878. Each of the main divisions, however defined by different naturalists, is subdivided into several subregions or provinces, more or less minutely in different systems. The difference lies in the way in which the larynx is used, but the exact nature of the process is disputed. The so-called *head-register* and *chest-register* include tones that call the cavities of the head and chest respectively into decided sympathetic vibration. The different vocal qualities are also called the *low*, *middle*, and *high registers*, or the *thick*, *middle*, and *thin registers*, depending in the first case upon the pitch of the tones for which they are best suited, and in the second upon the supposed condition of the vocal cords in producing them, or the quality of the tones produced.

2. Specifically, in the *law of conveyancing*, a system for the recording of conveyances, mortgages, and other instruments affecting the title to real property, in a public office, for the information of all concerned. The general policy of registry laws is to make a duly registered instrument notice to all the world, so that no one can claim any advantage over the registered owner by dealing with an unregistered owner or claimant in ignorance of the registered title. Under some systems a specified time is allowed for registering; and in some neglect to register an instrument within the time limited marks it with infirmity. The more generally accepted principle is to give effect to each instrument in the order of its registration, as against all unregistered instruments of which the purchaser, etc., had no actual notice. Another important element in registry laws is a provision that the record or certified copy shall be evidence in all courts equally as the original; but in some systems the non-production of the original must be accounted for before the record can be received in lieu of it.

The vessel is considered to belong to the port at which she is registered.—**Registration of copyright**, the name given in England to the recording of the title of a book for the purpose of securing the copyright: corresponding to *entry of copyright* in the United States.—**Registration of trade-marks**, the system by which one claiming the exclusive right to a trade-mark may register it for the purpose of giving public notice of his claim, and preserving record evidence thereof from the time of entry.—**Registration of voters or electors.** (*a*) In the United States, a system for the prevention of frauds in the exercise of the suffrage, by requiring voters to cause their names to be registered in books provided for the purpose in each election district, with appropriate particulars of residence, age, etc., to enable investigation to be made, and the right of the voter to cast the ballot to be challenged, if there be occasion. (*b*) Since Kant, a rule showing what we ought to assume, without giving any assurance that the fact to be assumed is true; or a proposition which will lead to the truth if it be true, while if it be false the truth cannot be attained: such, for example, is the rule that we must not despair of answering any question by sufficient investigation. (*c*) A rule of conduct which, if it be pursued, may lead us to our desired end, while, if it be not pursued, that end cannot be attained in any way.—**Regulative use of a conception.** See *constitutive use of a conception*, under *constitutive*.

regulator (reg'ū-lā-tor), *n.* [= F. *régulateur* = Sp. Pg. *regulador* = It. *regolatore*, < ML. *regulator*, a regulator, ruler, < *regulare*, regulate: see *regulate*.] 1. One who or that which regulates. Members of the unauthorized associations which have at various times been formed in parts of the United States for the carrying out of a rough substitute for justice in the case of heinous or notorious crimes have been called *regulators*.

2. A mechanical contrivance intended to produce uniformity of motion, temperature, power, etc. (*a*) In *engin.* and *mach.*: (1) A governor in the sense described and illustrated under *governor*, 6. (2) A governor employed to control the closing of the port-opening for admission of steam to the cylinder of an automatically variable cut-off steam-engine. This is a numerous class of regulators, in which the ball-governor described under *governor*, 6, is used to control the motion of the induction-valve instead of that of the throttle-valve. By leaving the throttle-valve fully open and closing the induction-valve earlier or later in the stroke, the steam arrives in the cylinder nearly at full pressure, and with its full store of available heat for conversion into work by expansion. (3) An arrangement of weights, springs, and an eccentric or eccentrics, carried on the fly-wheel shaft or on the fly-wheel of a steam-engine, connected with the stem of the induction-valve by an eccentric-rod, and automatically varying

a, fly-wheel shaft; *a*, *b*, and *a*, *b*′, eccentricities in different positions of the eccentrics *c* and *d*. The eccentric *c* turns freely on the shaft *a*, and is actuated by links *r*, that are pivoted to ears formed on the eccentric, and are also pivoted to weights *f*. The weights have the form of curved bars, and are pivoted at one end to spokes of the wheel, as shown at *g*. The eccentric *d* is fitted to and turns freely upon the perimeter of the eccentric *c*. It is also connected by a link *h* to the toe of one of the weights, and is rotated on *c* by the motion of the weight toward or away from the center of the shaft *a*. The eccentric *c* is also rotated on the shaft *a* by the motion of the weights to or from the center of the shaft, but it is turned in a direction opposite to that in which *d* is turned. These two eccentricities, therefore, constitute a compound eccentric, the eccentricity or "throw" of which varies with the position of the weights, while the "lead" remains practically the same. Coiled springs *k* constantly press the weights *f* toward the center, and the action of these springs is more or less overcome by centrifugal force as the shaft *a* rotates with greater or less velocity. The higher the velocity the less will be the throw of the valve and the shorter the cut off, and vice versâ. Fig. 1 shows the weights in their extreme outward position, in which the throw *ab* is the least possible. Fig. 2 shows the extreme inward position of the weights, in which the throw *ab* is the greatest possible. The range of variable cut-off is thus carried from simple lead to 0.7 of the stroke, and a very small percentage of change in the velocity is sufficient to change the cut off from its least to its greatest limit.

the cut-off, maintaining a uniform speed of rotation under conditions of widely varying work. One of the most ingenious and scientific of this class is illustrated in the cut with an accompanying explanation. (4) A throttle-valve. (5) The induction-valve of a steam-engine. (6) The brake-band of a crab or crane which regulates the descent of a body raised by or suspended on a machine. (*b*) In heating apparatus: (1) A register. (2) A thermostat. (3) An automatic draft-damper for the furnace or fire box of a steam-boiler. Also called *damper-regulator*. (*c*) In *horol.*: (1) A clock of superior order, by comparison with which other time-pieces are regulated. (2) A clock which, being electrically connected with other clocks at a distance, causes them to keep time in unison with it. (3) A device (commonly a screw and small nut) by which the bob of a pendulum is raised or lowered, causing the clock to go faster or slower. (4) The fly of the striking mechanism of a clock. (See *fly*[1], 3 (*a*) (1).) (5) A small lever which shortens or lengthens the hair-spring of a watch, thus causing the watch to go faster or slower according as the regulator is moved toward a part marked *F.* or *S.* (*d*) In the electric light, the contrivance, usually an electromagnet, by which the carbon-points are kept at a constant distance, so that the light is steady (see *electric light*, under *electric*); or, in general, a contrivance for making the current produced by the dynamo-machines of constant strength.—**Many-light regulator**, a regulator for voltaic arc-lights, controlling numerous lights on one circuit.—**Regulator-box.** (*a*) A valve-chest or -box. (*b*) The original valve-motion of Watt's double-action condensing pumping-engine. It was a valve-box having a spindle through one of its sides, on which was a toothed sector working on a central bearing, and meshing with a rack attached to a valve. A tripping-lever attached to the sector and operated by the plug-tree caused the oscillations of the latter to open and close the valve.—**Regulator-cock**, one of the oil cocks which admit oil to the steam-chest or valve-chest of a locomotive engine.—**Regulator-cover**, the cover or bonnet of a valve-chest or steam-chest of a steam-engine cylinder.—**Regulator-shaft** and **-levers**, in locomotive engines, the shaft and levers placed in front of the smoke-box when each cylinder has a separate regulator: now collectively called *valve-gear* or *valve-motion*.—**Regulator-valve**, a throttle-valve.

reh (rā), *n.* [Hind.] A saline efflorescence rising to the surface and covering various extensive tracts of land in the Indo-Gangetic alluvial plain, rendering the soil worthless for cultivation. It consists chiefly of sodium sulphate mixed with more or less common salt (sodium chlorid) and sodium carbonate. It is known in the Northwest Provinces of India as *reh*, and further west, in the Upper Punjab, as *kalar* or *kullar*.

Those who have travelled through Northern India cannot fail to have noticed whole districts of land as white as if covered with snow, and entirely destitute of vegetation. . . . This desolation is caused by *reh*, which is a white flocculent efflorescence, formed of highly soluble sodium salts, which are found in almost every soil. Where the subsoil water-level is sufficiently near the surface, the strong evaporating force of the sun's heat, aided by capillary attraction, draws to the surface of the ground the water holding these salts in solution, and these compel the water, which passes off in the form of vapour, to leave behind the salts it held as a white efflorescence.
A. G. F. Eliot James, Indian Industries, p. 195.

This old law-term [rehabilitate] has been gaining ground ever since it was introduced into popular discourse by Burke, to whom it may have been suggested by the French réhabiliter. Equally with its substantive, *rehabilitation*, it enables us to dispense with a tedious circumlocution.

A deer of the genus *Rangifer* or *Tarandus*, having horns in both sexes, and inhabiting arctic and cold temperate regions; the *Cervus tarandus*, *Rangifer tarandus*, or *Tarandus rangifer*.

Reindeer (*Rangifer tarandus*).

It has branched, recurved, round antlers, the crowns of which are more or less palmated; the antlers of the male are much larger than those of the female, and are remarkable for the size and asymmetry of the brow-antler. The body is of a thick and square form, and the legs are shorter in proportion than those of the red-deer. The size varies much according to climate: about 4 feet 6 inches may be given as the average height of a full-grown specimen. The reindeer is keen of sight and swift of foot, being capable of maintaining a speed of 9 or 10 miles an hour for a long time, and can easily draw a weight of 200 pounds, besides the sledge to which it is usually attached when used as a beast of draft. Among the Laplanders the reindeer is a substitute for the horse, the cow, and the sheep, as it furnishes food, clothing, and the means of conveyance. The caribou of North America, if not absolutely identical with the reindeer, would seem to be at least a well-marked variety, usually called *R. caribou*. 3. A character of a plurality of things; a fact concerning two or more things, especially and more properly when it is regarded as a predicate of one of the things connecting it with the others; the condition of being such and such with regard to something else: as, the *relation* of a citizen to the state; the *relation* of demand and supply. Thus, suppose a locomotive blows off steam; this fact constitutes a relation between the locomotive and the steam so far as the "blowing" is conceived to be a character of the locomotive, and another relation so far as the "being blown" is conceived as a character of the steam, and both these relations together are embraced in the same relationship or plural fact. This latter, also often called a *relation*, is by logicians called the *foundation* of the relation. The two or more subjects or things to which the plural fact relates are termed the *relates* or *correlates*, the one which is conceived as subject is specifically termed the *subject* of the relation, or the *relate*; the others the *correlates*. Words naming things in their character as relates are called *relatives*, as father, cousin. A set of relatives referring to the same relationship according as one or another object is taken as the relate are called *correlatives*: such are buyer, seller, commodity, price. The logical nomenclature of relations depends on the consideration of *individual relations*, or relations subsisting between the individuals of a single set of correlates, as opposed to *general relations* which, really or in conception, subsist between many such sets. Relations are either *dual*—that is, connecting couples of objects, as in the examples above—or *plural*—that is, connecting more than two correlates, as the relation of a buyer to the seller, the thing bought, and the price. Every individual dual relation is either a relation of a thing to itself or a relation of a thing to something else. *Logical relations* are those which are known from logical reflection: opposed to *real relations* which are known by generalization and abstraction from ordinary observations. The chief logical relations are those of *incompossibility*, *coexistence*, *identity*, and *otherness*. Real dual relations are of five classes: (1) *differences* or *also relations*, being relations which nothing can bear to itself, as being greater than; (2) *ubi-relations* or *concurrences*, being relations which nothing can bear to anything else, as self-consciousness; (3) *agreements*, or relations which everything bears to itself, as similarity; (4) relations which everything bears to everything else, which may be called *distances*; and (5) *variform relations*, which some things only bear to themselves, and which subsist between some pairs of things only. Other divisions of relations are important in logic, as the following. An *iterative* or *repeating relation* is such that a thing may at once be in that relation and its converse to the same or different things, as the relation of father to son, or spouse to spouse: opposed to a *final* or *non-repeating relation*, as that of husband to wife. An *equiparance* or *convertible relation* opposed to a *disquiparance* or *inconvertible relation*, is such that, if anything is in that relation to another, the latter is in the same relation to the former, as that of cousins. A relation which cannot subsist between two things reciprocally, as that of greater and less, may be called an *ir reciprocable relation*, opposed to a *reciprocable relation*, which admits reciprocation as possible merely. A relation such that if A is so related to B, and B so related to C, then A is so related to C, is called a *transitive*, in opposition to an *intransitive relation*. A relation such that if A is so related to something else, C, there is a third thing, B, which is so related to C, and to which A is so related, is called a *concatenated*, in opposition to an *inconcatenated relation*. A relation subsisting between objects in an endless or self-returning series is called an *inexhaustible*, in opposition to an *exhaustible relation*. If there is a self returning series, the relation is termed *cyclic*, in opposition to *acyclic*. A transitive relation such that of any two objects of a certain category one has this relation to the other may be called a *linear relation*; and the series of objects so formed may be called the *line* of the relation. According as this is continuous or discontinuous, finite or infinite, and in the latter case discretely or absolutely, these designations may be applied to the relation. According to the nominalistic (including the conceptualistic) view, a relation is a mere product of the mind. Adding to this doctrine that of the relativity of knowledge that we know only relations, Kant reached his conclusion that things in themselves are absolutely incognizable. But most Kantian students come to deny the existence of things in themselves, and so reach an idealistic realism which holds relations to be as real as any facts. The realistic view is expressed in the dictum of Scotus that every relation without which, or a term of which, its foundation cannot be is, in the thing (*realiter*), identical with that foundation—that is, what really is is

a fact relating to two or more things, and that fact viewed as a predicate of one of those things is the relation.

Thus is *relacion* rect, ryht as adiectif and substantif
A-cordeth in alle kyndes with his antecedent.
Piers Ploweman (C), iv. 363.

The last sort of complex ideas is that we call *relation*, which consists in the consideration and comparing one idea with another. *Locke*, Human Understanding, ii. 12.

The only difference between relative names and any others consists in their being given in pairs, and the reason of their being given in pairs is not the existence between two things of a mystical bond called a *relation* and supposed to have a kind of shadowy and abstract reality, but a very simple peculiarity in the concrete fact which the two names are intended to mark
J. S. Mill, Note to James Mill's Human Mind, xiv. 2.

In natural science, I have understood, there is nothing petty to the mind that has a large vision of *relations*.
George Eliot, Mill on the Floss, iv. 1.

Most *relations* are feelings of an entirely different order from the terms they relate. The *relation* of similarity, e. g., may equally obtain between jasmine and tuberose, or between Mr Browning's verses and Mr Story's; it is itself neither odorous nor poetical, and those may well be pardoned who have denied to it all sensational content whatever *W. James*, Mind, XII. 13.

4. Intimate connection between facts; significant bearing of one fact upon another.

For the intent and purpose of the law
Hath full *relation* to the penalty,
Which here appeareth due upon the bond.
Shak., M. of V., iv. 1. 248.

The word *relation* is commonly used in two senses considerably different from each other. Either for that quality by which two ideas are connected together in the imagination, and the one naturally introduces the other . . . ; or for that particular circumstance in which . . we may think proper to compare them . . . In a common way we say that "nothing can be more distant than such or such things from each other, nothing can have less *relation*," as if distance and *relation* were incompatible.
Hume, Human Nature, part i. § 5.

5. Connection by consanguinity or affinity; kinship; tie of birth or marriage; relationship.

Relations dear, and all the charities
Of father, son, and brother, first were known.
Milton, P. L., iv. 756.

6. Kindred; connection; a group of persons related by kinship. [Rare.]

He hath need of a great stock of piety who is first to provide for his own necessities, and then to give portions to a numerous *relation*
Jer. Taylor, Works (ed. 1835), I. 614.

7. A person connected by consanguinity or affinity; a kinsman or kinswoman; a relative.

Sir, you may spare your application,
I'm no such beast, nor his *relation*.
Pope, Imit. of Horace, I. vii. 60.

I am almost the nearest *relation* he has in the world, and am entitled to know all his dearest concerns.
Jane Austen, Pride and Prejudice, lvi.

8. In *math.*: (*a*) A ratio; proportion. (*b*) A connection between a number of quantities by which certain systems of values are excluded; especially, such a connection as may be expressed by a plexus of general equations.—**9.** In *music*, that connection or kinship between two tones, chords, or keys (tonalities) which makes their association with each other easy and natural. The relation of tones is perceived by the ear without analysis Physically it probably depends upon how far the two series of upper partial tones or harmonics coincide. Thus, a given tone is closely related to its perfect fifth, because the 2d, 5th, 8th, 11th, etc., harmonics of the one are respectively identical with the 1st, 3d, 5th, 7th, etc., of the other; while for converse reasons it is hardly at all related to its minor second. Tones that have but a distant relation to each other, however, are often both closely related to a third tone, and then, particularly if they are associated together in some melodic series, like a scale, may acquire a close relation. Thus, the seventh and eighth tones of a major scale have a close relation which is indirectly harmonic, but apparently due to their habitual melodic proximity. The relation of chords depends primarily on the identity of one or more of their respective tones. Thus, a major triad is closely related to a minor triad on the same root, or to a minor triad on the minor third below itself, because in each case there are two tones in common Thus, the tonic triad of a key is related to the dominant and subdominant triads through the identity of one of its tones with one of theirs. As with tones, chords having but a distant relation to each other may acquire a relation through their respective close relations to a third chord, especially if habitually brought together in harmonic progressions. Thus, the dominant and subdominant triads of a key have a substantial but indirect relation, and, indeed, a relation is evident between all the triads of a key. The relation of keys (tonalities) depends properly on the number of tones which they have in common though it is often held that a key is closely connected with every key whose tonic triad is made up of its tones. Thus, a major key is most intimately related to the major keys of its dominant and subdominant and to the minor key of its submediant, because each of them differs from it by but one tone and also to the minor keys of its mediant and supertonic, because their tonic triads are also composed of its tones. Hence a major key and the minor key of its submediant are called mutually relative (*relative major* and *relative minor*), in distinction from the tonic major and tonic minor, which are more distantly related When carefully analyzed, the fact of relation is found to be profoundly concerned in the entire structure and development of music. It has caused the establishment of the major diatonic scale as the norm of all modern music. It is the kernel of tonality, of harmonic and melodic progression, of form in general, and of many extended forms in particular.

10. In *law*: (*a*) A fiction of law whereby, to prevent injustice, effect is given to an act done at one time as if it had been done at a previous time, it being said to have *relation* back to that time: as, where a deed is executed and acted on, but its delivery neglected, the law may give effect to its subsequent delivery by *relation* back to its date or to its execution, as may be equitable. (*b*) Suggestion by a relator; the statement or complaint of his grievance by one at whose instance an action or special proceeding is brought by the state to determine a question involving both public and private right.—**11.** In *arch.*, the direct dependence upon one another, and upon the whole, of the different parts of a building, or members of a design.—**Abelian relation**, a relation expressed by certain identical linear equations given by Abel connecting roots of unity with the roots of the equation which gives the values of the elliptic functions for rational functions of the periods. —**Accidental relation**, an indirect relation of A to C, constituted by A being in some relation to B, and B being in an independent relation to C. Thus, if a man throws away a date-stone, and that date-stone strikes an invisible genie, the relation of the man to the genie is an accidental one. **Actual relation.** See *actual*.—**Aggregate relation.** (*a*) A relation resulting from a disjunctive conjunction of several relations, such that, if any of the latter are satisfied, the aggregate relation is satisfied. (*b*) Same as *composite relation* (*a*). [This is the signification attached to the word by Cayley, contrary to the established terminology of logic.] **Alio relation**, a relation of such a nature that a thing cannot be in that relation to itself: as, being previous to.—**Aptitudinal relation.** See *aptitudinal*.—**Categories of relation.** See *category*, 1. —**Composite relation.** (*a*) A relation consisting in the simultaneous existence of several relations. (*b*) Same as *aggregate relation* (*a*). [This is the signification attached to the phrase by Cayley, in opposition to the usage of logicians.]—**Confidential, cyclical, discriminant relation.** See the adjectives. **Definite relation**, a relation unlike any relation of the same relate to other correlates. [This is Kempe's nomenclature, but is objectionable. *Peculiar relation* would better express the idea.]—**Distributively satisfied composite relation.** See *distributively*.—**Double relation, dual relation**, relation between a pair of things, or between a relate and a single correlate.—**Dynamic relations.** See *dynamic*.—**Enharmonic relation.** See *enharmonic*. **Exterior relations.** See *exterior*.—**Extrinsic relation**, a relation which is established between terms already existing.—**False or inharmonic relation**, in *music*. See *false*.—**In relation to**, in the characters that connect the subject with the correlate which is the object of the preposition *to*: as, music *in relation to* poetry (music in those characters that connect it with poetry).—**Intrinsic relation.** See *intrinsic*.—**Involutorial relation.** See *involutorial*.—**Irregular relation**, a relation not regular. —**Jacobian relation**, the relation expressed by equating the Jacobian to zero.—**K-fold relation**, a relation which reduces by *k* the number of independent ways in which a system of quantities may vary.—**Legal relation**, the aggregate of legal rights and duties characterizing one person or thing in respect to another.—**Omal relation**, a relation expressed by a system of linear equations. [With Legendre, *omal* means having the differential coefficient constantly of one sign; but Cayley uses the word as a synonym of *homaloidal* or *linear*.]—**Order of a relation**, in *math.* See *order*, 12.—**Parametric relation**, a relation involving parameters, or variables over and above the coordinates.—**Plural relation**, a relation between a relate and two or more correlates, as when A aims a shot, B, at C.—**Predicamental relation**, a relation which comes under Aristotle's category of relation.—**Prime relation**, a relation not resulting from the conjunction of relations alternatively satisfied.—**Real relation**, a relation the statement of which cannot be separated into two facts, one relating to the relate and the other to the correlate, such as the relation of Cain to Abel as his killer. For the facts that Cain killed somebody and that Abel was killed do not together make up the fact that Cain killed Abel: opposed to *relation of reason*.—**Regular relation**, a relation of definite manifoldness. [So defined by Cayley; but it would have been better to denominate this a *homoplasmal relation*, reserving the term *regular relation* for one which follows one law, expressible by general equations, for all values of the coördinates—this meaning according better with that usually given to *regular*.]—**Relation of disquiparance**, a relation which confers unlike names upon relate and correlate.—**Relation of equiparance**, a relation which confers the same relative name upon relate and correlate: thus, the being a cousin of somebody is such a relation, for if A is cousin to B, B is cousin to A. **Relation of reason**, a relation which depends upon a fact which can be stated as an aggregate of two facts (one concerning the relate, the other concerning the correlate), such that the annihilation of the relate or the correlate would destroy only one of these facts, but leave the other intact: thus, the fact that Franklin and Rumford were both scientific Americans constitutes a relationship between them with two correlative relations; but these are *relations of reason*, because the two facts are that Franklin was a scientific American and that Rumford was a scientific American, the first of which facts would remain true even if Rumford had never existed, and the second even if Franklin had never existed. —**Resultant relation**, a relation between parameters involved in a superdeterminate relation.—**Self-relation.** (*a*) A relation of such a sort that a thing can be in that relation to itself: as, being the killer of; but better (*b*) a relation of such a sort that nothing can be so related to anything else, as the relations of self-consciousness, self-deprecation, self-help, etc.—**Superdeterminate relation**, a relation whose manifoldness is as great as or greater than the number of coördinates.—**Transcendental relation**, a relation which does not come under Aristotle's category of relation, as cause and effect, habit and object.=**Syn. 1.** *Narration, Recital*, etc. See *account*. —3. Attitude, connection.—5. Affiliation.—5 and 7. *Relation, Relative, Connection*. When applying to family affiliations, *relation* is used of a state or of a person, but in the latter sense *relative* is much better; *relative* is used of a person, but not of a state; *connection* is used with equal propriety of either person or state *Relation* and *relative* refer to kinship by blood; *connection* is increasingly restricted to ties resulting from marriage.—6. Kindred, kin.

2. Indicating or specifying some relation: used in contradistinction to *notional*: as, a *relational* part of speech. Pronouns, prepositions, and conjunctions are *relational* parts of speech.

relationality (rē-lā-shō-nal'i-ti), *n.* [< *relational* + *-ity*.] The state or property of having a relational force.

But if the remarks already made on what might be called the *relationality* of terms have any force, it is obvious that mental tension and conscious intensity cannot be equated to each other. *J. Ward*, Mind, XII. 56.

relationism (rē-lā'shon-izm), *n.* [< *relation* + *-ism*.] **1.** The doctrine that relations have a real existence.

Relationism teaches . . . that things and relations constitute two great, distinct orders of objective reality, inseparable in existence, yet distinguishable in thought.
C. E. Abbot, Scientific Theism, Introd., ii.

2. The doctrine of the relativity of knowledge.

relationist (rē-lā'shon-ist), *n.* [< *relation* + *-ist*.] **1†.** A relative; a relation. *Sir T. Browne.* —**2.** An adherent of the doctrine of relationism.

relationship (rē-lā'shon-ship), *n.* [< *relation* + *-ship*.] **1.** The state of being related by kindred, affinity, or other alliance.

Faith is the great tie of *relationship* betwixt you [and Christ]. *Chalmers*, On Romans viii 1 (ed. R. Carter).

Mrs Mugford's conversation was incessant regarding the Ringwood family and Firmin's *relationship* to that noble house. *Thackeray*, Philip, xxi.

2. In *music*, same as *relation*, 8. Also called *tone-relationship*.

Conjunctions, prepositions (personal, relative, and interrogative), *relatival* contractions.
E. A. Abbott, Shakespearian Grammar (cited in The [Nation, Feb. 16, 1871, p. 110).

relative (rel'a-tiv), *a.* and *n.* [< ME. *relatif*, < OF. (and F.) *relatif* = Pr. *relatiu* = Sp. Pg. It. *relativo*, < LL. *relativus*, having reference or relation, < L. *relatus*, pp. of *referre*, refer, relate: see *refer*, *relate*.] **I.** *a.* **1.** Having relation to or bearing on something; close in connection; pertinent; relevant; to the purpose.

The devil hath power
To assume a pleasing shape; yea, and perhaps . . .
Abuses me to damn me. I'll have grounds
More *relative* than this. *Shak.*, Hamlet, ii. 2. 638.

2. Not absolute or existing by itself; considered as belonging to or respecting something else; depending on or incident to relation.

Everything sustains both an absolute and a *relative* capacity: an absolute, as it is such a thing, endued with such a nature; and a *relative*, as it is a part of the universe, and so stands in such a relation to the whole.
South.

Not only simple ideas and substances, but modes also, are positive beings: though the parts of which they consist are very often *relative* one to another.
Locke, Human Understanding, II. xxvi. § 6.

Religion, it has been well observed, is something *relative* to us; a system of commands and promises from God towards us. *J. H. Newman*, Parochial Sermons, i. 317.

3. In *gram.*, referring to an antecedent; introducing a dependent clause that defines or describes or modifies something else in the sentence that is called the antecedent (because it usually, though by no means always, precedes the relative): thus, he *who* runs may read; he lay on the spot *where* he fell. Pronouns and pronominal adverbs are relative, such adverbs having also the value of conjunctions. A relative word used without an antecedent, as implying in itself its antecedent, is often called a *compound relative*: thus, *who* breaks pays; I saw *where* he fell. Relative words are always either demonstratives or interrogatives which have acquired secondarily the relative value and use.

4. Not intelligible except in connection with something else; signifying a relation, without stating what the correlate is: thus, *father, better, west*, etc., are *relative* terms.

Profundity, in its secondary as in its primary sense, is a *relative* term. *Macaulay*, Sadler's Ref. Refuted.

5. In *music*, having a close melodic or harmonic relation. Thus, *relative chords*, in a narrow sense, the triads of a given key (tonality) having as roots the successive tones of its scale; *relative keys*, keys (tonalities) having several tones in common, thus affording opportunity for easy modulation back and forth, or, more narrowly, keys whose tonic triads are relative chords of each other; *relative major*, *relative minor*, a major key and the minor key of its submediant regarded with respect to each other. Also *related*, *parallel*. See cut under *chord*, 4.—**Relative beauty**, beauty consisting in the adaptation of the object to its end.—**Relative chronology**, in *geol.*, the geological method of computing time, as opposed to the *absolute* or *historical* method.—**Relative end, ens, equilibrium.** See the nouns.—**Relative enunciation**, an enunciation whose clauses are connected by a relative: as, "Wheresoever the carcase is, there will the eagles be gathered together."—**Relative gravity.** (*a*) The acceleration of gravity at a station referred to that at another station, and not expressed in terms of space and time. (*b*) Same as *specific gravity* (which see, under *gravity*).—**Relative ground of proof**, a premise which itself requires proof.—**Relative humidity, hypermetropia, locality.** See the nouns.—**Relative motion.** See *motion*.—**Relative opposites**, the two terms of any dual relation.—**Relative place**, the place of one object as defined by the situations of other objects.—**Relative pleasure or pain**, a state of feeling which is pleasurable or painful by force of contrast with the state which preceded it.—**Relative pronoun, proposition**, etc. See the nouns.—**Relative syllogism**, a syllogism whose major premise is a relative enunciation: as Where Christ is, there will also the faithful be, but Christ is in heaven; therefore there also will the faithful be.—**Relative term**, a term which, to become the complete name of any class, requires to be completed by the annexation of another name, generally of another class: such terms are, for example, father of, the qualities of, tangent to, identical with, man that is, etc. Strictly speaking all adjectives are of this nature.—**Relative time**, the sensible measure of any part of duration by means of motion.

II. *n.* 1. Something considered in its relation to something else; one of two things having a certain relation.—2. A person connected by blood or affinity; especially, one allied by blood; a kinsman or kinswoman; a relation.

relativeness (rel'a-tiv-nes), *n.* The state of being relative or having relation.

Therefore, while for a later period of the dialect-life of Hellas the expression "dialect" is one of peculiar *relativeness*, it is a justifiable term for certain aggregations of morphological and syntactical phenomena in the earlier periods of language, when dialect-relations were more sharply defined. *Amer. Jour. Philol.*, VII. 444.

relativity (rel-a-tiv'i-ti), *n.* [= F. *relativité*, < NL. **relativita(t-)s*, < LL. *relativus*, relative: see *relative*.] 1. The character of being relative; relativeness; the being of an object as it is by force of something to which it is relative. Specifically—2. Phenomenality; existence as an immediate object of the understanding or of experience; existence only in relation to a thinking mind.—**The doctrine of the relativity of existence**, the doctrine that the real existence of the subject, and also of the object, depends on the real relation between them.—**The doctrine of the relativity of knowledge.** The phrase *relativity of knowledge* has received divergent significations. (*a*) The doctrine that it is impossible to have knowledge of anything except by means of its relations to the mind, direct and indirect, cognized as relations. (*b*) The doctrine of phenomenalism, that only appearances can be known, and that the relations of these appearances to external substrata, if such there be, are completely incognizable. This doctrine is sometimes associated with a denial of the possibility of any knowledge of relations as such, or at least of any whose terms are not independently present together in consciousness. It would therefore better be denominated *the doctrine of the impossibility of relativity of cognition*. (*c*) The doctrine that we can only become conscious of objects in their relations to one another. This doctrine is almost universally held by psychologists.

Relative and correlative are each thought through the other, so that in enouncing *relativity* a condition of the thinkable—in other words, that thought is only of the relative—this is tantamount to saying that we think one thing only as we think two things mutually and at once; which again is equivalent to the doctrine that the absolute (the non-relative) is for us incogitable, and even inconceivable.
Sir W. Hamilton, Metaph., App. V. (*c*).

When a philosopher lays great stress upon the *relativity of our knowledge*, it is necessary to cross-examine his writings, and compel them to disclose in which of its many degrees of meaning he understands the phrase. . . . To most of those who hold it, the difference between the Ego and the Non-ego is not one of language only, nor a formal distinction between two aspects of the same reality, but denotes two realities, each having a separate existence, and neither dependent on the other. . . . They believe that there is a real universe of "things in themselves," and that whenever there is an impression on our senses, there is a "thing in itself," which is behind the phenomenon, and is the cause of it. But as to what this thing is "in itself," we, having no organs except our senses for communicating with it, can only know what our senses tell us, and as they tell us nothing but the impression which the thing makes upon us, we do not know what it is in itself at all. . . . Of the ultimate realities, as such, we know the existence, and nothing more. . . . It is in this form that *the doctrine of the relativity of knowledge* is held by the greater number of those who profess to hold it, attaching any definite idea to the term.
J. S. Mill, Examination of Hamilton, ii.

For this *relief*, much thanks; 'tis bitter cold,
And I am sick at heart. *Shak.*, Hamlet, i. 1. 8.

5. One who relieves another, as from a post of duty; a soldier who relieves another who is on guard; collectively, a company of soldiers who relieve others who are on guard.

Even in front of the National Palace the sentries on duty march up and down their beats in a slipshod fashion, while the *relief* loll about on the stone benches, smoking cigarettes and otherwise making themselves comfortable.
Harper's Mag., LXXIX. 820.

6. In *sculp.*, *arch.*, etc., the projection (in *painting*, the apparent projection) of a figure or feature from the ground or plane on which it is formed. Relief is, in general, of three kinds: high relief (*alto rilievo*), low relief (*basso rilievo*, *bas relief*), and middle or half relief (*mezzo-rilievo*). The distinction lies in the degree of projection. *High relief* is that in which

the figures project at least one half of their natural circumference from the background. In *low relief* the figures project but slightly from the ground, in such a manner that no part of them is entirely detached from it, as in medals, the chief effect being produced by the treatment of light and shadow. *Middle* or *half relief* is intermediate between the other two. The varieties of relief are still further distinguished as *stiacciato rilievo*, or very flat relief, the lowest possible relief, of which the projection in parts hardly exceeds the thickness of a sheet of paper; and *cavo-rilievo*, hollow relief, also called *intaglio rilevato*, or celanaglyphic sculpture, an Egyptian form of relief obtained by cutting a furrow with sloping sides around a figure previously outlined on a stone surface, leaving the highest parts of the finished work on a level with the original surface-plane. See also cut in next column, and cuts under *orant*, *Proserpine*, *alto-rilievo*, and *bas-relief*

8. In *her.*, the supposed projection of a charge from the surface of the field, represented by shading with a heavier bounding-line on the sinister side and toward the base than on the dexter side and toward the chief. Thus, if an escutcheon is divided into seven vertical stripes, alternately red and white, it would not be blazoned paly of seven gules and argent, as the rule is that paly is always of an even number, but the sinister side of three alternate stripes would be shaded to indicate relief, and the blazoning would be gules, three pallets argent, the assumption being that the pallets are in relief upon the field.

9. In *phys. geog.*, the form of the surface of any part of the earth, considered in the most general way, and with special regard to differences of elevation: little used except in the name *relief-map*, by which is meant a geographical or geological map in which the form of the surface is expressed by elevations and depressions of the material used. Unless the scale of such relief maps is very large, there must be considerable exaggeration, because differences of vertical elevations in nature are small as compared with superficial extent. Relief-maps are occasionally made by preparing a model of the region it is desired to exhibit, and then photographing this model under an oblique illumination. The relief of the surface is also frequently indicated on maps by various colors or by a number of tints of one color. Both hachure and contour-line maps also indicate the relief of the surface, to a greater or less extent, according to their scale and artistic perfection. Thus, the Dufour map of Switzerland, especially when photographed down to a small size, has in a very striking degree the effect of a photograph from an actual model, although in reality a hachure map.

10. In *fort.*, the perpendicular height of the interior crest of the parapet above the bottom of the ditch.—11. Prominence or distinctness given to anything by something presenting a contrast to it, or brought into close relation with or proximity to it; a contrast.

14. In *law*, that which a court of justice awards to a suitor as redress for the grievance of which he complains.—15. In *feudal law*, a fine or composition which the heir of a tenant holding by knight's service or other tenure paid to the lord at the death of the ancestor, for the privilege of succeeding to the estate, which, on strict feudal principles, had lapsed or fallen to the lord on the death of the tenant. This relief consisted of horses, arms, money, etc., the amount of which was originally arbitrary, but afterward fixed by law. The term is still used in this sense in Scots law, being a sum exigible by a feudal superior from the heir who enters on a feu. Also called *casualty of relief*.

On taking up the inheritance of lands, a *relief* [was paid to the king]. The *relief* originally consisted of arms, armour and horses, and was arbitrary in amount, but was subsequently "ascertained," that is, rendered certain, by the Conqueror, and fixed at a certain quantity of arms and habiliments of war. After the assize of arms of Henry II., it was commuted for a money payment of 100*s.* for every knight's fee, and as thus fixed continued to be payable ever afterwards. *S. Dowell*, Taxes in England, I. 25.

Absolute relief, in *fort.*, the height of any point of a work above the bottom of the ditch.—**Alternative relief**, in *law*, different modes of redress asked in the alternative, usually because of uncertainty as to some of the facts, or because of a discretionary power in the court to award either. **Bond of relief.** See *bond*[1].—**Constructive relief**, in *fort.*, the height of any point of a work above the plane of construction.—**Conversion of relief.** See *conversion*.—**Indoor relief**, accommodation in the poor-house, as distinguished from *outdoor relief*, the assistance given to those paupers who live outside. In 1847 the Relief and United Secession churches amalgamated, forming the United Presbyterian Church.—**Relief law.** See *law*[1].—**Relief processes**, those processes in mechanical or "process" engraving by which are produced plates or blocks with raised lines, capable of being printed from like type, or together with type, in an ordinary press.—**Relief satiné**, or **satiné relief.** Same as *raised satin-stitch* (which see, under *satin stitch*).—**Roman Catholic Relief Acts.** See *Catholic*.—**Specific relief**, in *law*, action of the court directly on the person or property, as distinguished from that in which an award of damages only is made, to be collected by execution.—**Syn. 1.** Mitigation.—**2.** Help, aid, support.

relief-perspective (rē-lēf'pėr-spek"tiv), *n.* The art of constructing homological figures in space, and of determining the relations of the parts of bas-reliefs, theatrical settings, etc., to make them look like nature. Every such representation refers to a fixed center of perspective and to a fixed plane of homology. The latter in a theater setting is the plane in which the actors generally stand; in a bas-relief it is the plane of life-size figures. Every natural plane is represented by a plane cutting it in a line lying in the plane of homology. Every natural point is represented by a point in the same ray from the center of perspective. The plane of homology represents itself, and the center of perspective represents itself. One other point can be taken arbitrarily to represent a given point. There is a vanishing plane parallel to the plane of homology, which represents the portions of space at an infinite distance.

Established religion, that form of religion in a country which is recognized and sanctioned by the state. See *establishment*, 6. — **Evidences of revealed religion.** See *evidences of Christianity*, under *Christianity*. — **Experimental religion.** See *experimental*. — **Natural religion**, that knowledge of and reverent feeling toward God, and that knowledge and practice of our duties toward our fellow-men, which is based on and derived from nature, apart from revelation. — **Religion of Humanity.** See *positive philosophy*, under *positive*. — **Revealed religion**, that knowledge of God and right feeling toward him, and that recognition and practice of duty toward our fellow men, which is derived from and based upon positive revelation. — **To experience religion.** See *experience*. — **To get religion.** See *get*[1]. = Syn. 1. *Religion, Devotion, Piety, Sanctity, Sanctimony, Godliness, Holiness, Religiosity.* In the subjective aspect of these words *religion* is the most general, as it may be also the most formal or external; in this sense it is the place of the will and character of God in the heart, so that they are the principal object of regard and the controlling influence. *Devotion* and *piety* have most of fervor. *Devotion* is a religion that consecrates itself, being both a close attention to God with complete inward subjection and an equal attention to the duties of religion. *Piety* is religion under the aspect of filial feeling and conduct, the former being the primary idea. *Sanctity* is generally used objectively; subjectively it is the same as *holiness*. *Sanctimony* is more concrete than *sanctity*, more distinctly a quality of a person, likeness to a saint, ripeness for heaven. *Godliness* is higher than *sanctimony;* it is likeness to God, or the endeavor to attain such likeness, fixed attention given immediately to God, especially obedience to his will and endeavor to copy his character. *Holiness* is the most absolute of these words; it is moral and religious wholeness, completeness, or something approaching so near to absolute freedom from sin as to make the word appropriate; it includes not only being free from sin, but refusing it and hating it for its own sake. *Religiosity* is not a very common nor a very euphonious word, but seems to meet a felt want by expressing a susceptibility to the sentiments of religion, awe, reverence, admiration for the teachings of religion, etc., without much disposition to obey its commands.

'to *pin* one's faith to a thing,' 'a man to *tie* to,' colloquial phrases containing the same figure); in this use it became, by omission of the object, intransitive, and, losing thus its etymological associations (the other use, 'bring together again, rally,' having also become obsolete), was sometimes regarded, and has been by some etymologists actually explained, as a barbarous compound of *re-* + L. *lie*[1], rest, whence appar. the occasional physical use (def. II., 3). But the pret. would then have been **relay*, pp. **relain*.] **I.** *trans.* 1†. To fasten; fix; attach.

remainder (rē-mān'dėr), *n.* and *a.* [< OF. *remaindre*, inf. used as a noun: see *remain*.] **I.** *n.* 1. That which remains; anything left after the separation, removal, destruction, or passing of a part.

As much as one sound cudgel of four foot—
You see the poor *remainder*—could distribute,
I made no spare, sir. *Shak.*, Hen. VIII., v. 4. 20.

What madness moves you, matrons, to destroy
The last *remainders* of unhappy Troy?
Dryden, Æneid, v.

2. In *math.*, the sum or quantity left after subtraction or after any deduction; also, the part remaining over after division: thus, if 19 be divided by 4, the *remainder* is 3, because 19 is three more than an exact multiple of 4. In the old arithmetics called the *remainer*.—3. In *law*, a future estate so created as to take effect in possession and enjoyment after another estate (as a life-interest) is determined; a remnant of an estate in land, depending upon a particular prior estate, created at the same time, and by the same instrument, and limited to arise immediately on the determination of that estate. (*Kent.*) It is thus distinguished from a *reversion*, which is the estate which by operation of law arises in the grantor or his heirs when a limited estate created without creating also a remainder comes to an end; and distinguished also from an *executory interest*, which may take effect although there be no prior estate upon the termination of which it is to commence in possession. At the time when by the common law no grant could be made but by livery of seisin, a person who wished to give to another a future estate was obliged to create at the same time an intermediate estate commencing immediately, and he could limit this temporary estate by the event which he wished to fix for the commencement of the ultimate estate, which was hence called the *remainder*—that is, what remained after the precedent or particular estate—and was said to be supported by the precedent or particular estate. (See *particular estate* and *executory estate*, both under *estate*.) A remainder is *vested* when the event which will terminate the precedent estate is certain to happen, and the person designated to take in remainder is in existence. The fact that the person may not survive to enjoy the estate, or that others may come into existence who will also answer the designation and therefore be entitled to share it with him, does not prevent the *remainder* from being deemed vested meanwhile.

With Julius Cæsar, Decimus Brutus had obtained that interest, as he set him down in his testament for heir in *remainder* after his nephew. *Bacon*, Friendship (ed. 1887).

4. In the *publishing trade*, that which remains of an edition the sale of which has practically ceased, and which is sold out at a reduced price.

In 1843 he felt strong enough to start as a publisher in Soho Square, his main dealings before this having been in *remainders*, and his one solitary publication a failure.
Athenæum, No. 3121, p. 850.

Contingent remainder, in *law*, a remainder which is not vested. The epithets *contingent* and *vested* are, however, often loosely used to indicate the distinction between remainders of which the enjoyment is in any way contingent and others.—**Cross remainder**, in *law*, that state of affairs in which each of two grantees or devisees has reciprocally a remainder in the property in which a particular estate is given to the other. Thus, if land be devised, one half to A for life with remainder to B in fee simple, and the other half to B for life with remainder to A in fee simple, these remainders are called *cross remainders*. Cross remainders arise on a grant to two or more as tenants in common, a particular estate being limited to each of the grantees in his share, with remainders to the other or others of them.=**Syn.** 1. *Rest*, *Remainder*, *Remnant*, *Residue*, *Balance*. *Rest* is the most general term; it may represent a large or a small part. *Remainder* and *residue* generally represent a comparatively small part, and *remnant* a part not only very small, but of little or no account. *Rest* may be applied to persons as freely as to things; *remainder* and *residue* only to things, but we may speak of the *remainder* of a party. *Remnant* and *residue* are favorite words in the Bible for *rest* or *remainder*, as in Mat. xxii. 6 and Isa. xxi. 17, but such use of them in application to persons is now antique. *Balance* cannot, literally or by legitimate figure, be used for *rest* or *remainder*: we say the *balance* of the time, week, space, party, money. It is a cant word of trade.

Thomson, Castle of Indolence, i. 57.

4. In *line-engraving* and *etching*: (*a*) A distinguishing mark or peculiarity of any kind, indicating any particular state of the plate prior to its completion. The remark may be a slight sketch made by the engraver on the margin of his plate, or it may consist merely in the absence of certain detail or features of the finished work. Thus, in a first proof of an etching the absence of retouching with the dry point, or of a final robbing, constitutes a remark, or in a line-engraving it may consist in the presence or absence of some minor object, or of certain lines representing texture or shading, which in a later state of the plate are removed or added.

The old legend still lingers that the *remargue* began when some unknown etcher tried his point upon the edge of his plate just before taking his first impressions. The belief yet obtains that the *remargue* testifies to the etcher's supreme satisfaction with a supreme effort. But as a matter of fact the *remargue* has become any kind of a fanciful supplementary sketch not necessarily appropriate, not always done by the etcher, and appearing upon a number of impressions which seem to be limited only at the will of artist or dealer. Sometimes we see 50 *remargue* proofs announced and again 300
New York Tribune, Feb. 6, 1887.

(*b*) A print or proof bearing or characterized by a remark; a remarked proof, or remark proof. Also written *remargue*. =Syn. 2. *Remark, Observation, Comment, Commentary, Reflection, Note, Annotation, Gloss.* A *remark* is brief and cursory, suggested by present circumstances and presumably without previous thought. An *observation* is made with some thought and care. A *comment* is a remark or observation bearing closely upon some situation of facts, some previous utterance or some published work. *Remark* may be substituted by modesty for *observation*. When printed, *remarks, observations* or *comments* may be called *reflections* as Burke's "*Reflections* on the Revolution in France;" when they are systematic in explanation of a work, they may be called a *commentary*, as Lange's "*Commentary* on Matthew." A *note* is primarily a brief writing to help the memory; then a marginal comment. *Notes* is sometimes used modestly for *commentary*, as, Barnes's "*Notes* on the Psalms." Trench's "*Notes* on the Parables." A marginal comment is more definitely expressed by *annotation*. A *gloss* is a comment made for the purpose of explanation, especially upon a word or passage in a foreign language or a peculiar dialect.

renaissance (rē-na-sons' or re-na'sans), *n.* and *a.* [F. *renaissance*, OF. *renaissance*, *renascence*, < ML. *renascentia*, new birth, see *renascence*.]

I. *n.* A new birth, hence, the revival of anything which has long been in decay or desuetude. Specifically [*cap.*] the movement of transition in Europe from the medieval to the modern world and especially the time, spirit, and activity of the revival of classical arts and letters. The earliest traces and most characteristic development of this revival were in Italy, where Petrarch and the early humanists and artists of the fourteenth century may be regarded as its precursors. The movement was greatly stimulated by the influx of Byzantine scholars who brought the literature of ancient Greece into Italy in the fifteenth century, especially after the taking of Constantinople by the Turks in 1453. The Italian Renaissance was at its height at the end of the fifteenth and in the early sixteenth century, as seen in the lives and works of such men as Lorenzo dei Medici, Michelangelo, Leonardo da Vinci, Raphael, Machiavelli, Politian, Ariosto, Correggio, Titian, and Aldus Manutius. The Renaissance was aided everywhere by the spirit of discovery and exploration of the fifteenth century — the age which saw the invention of printing, the discovery of America, and the rounding of Africa. In Germany the Renaissance advanced about the same time with the Reformation (which commenced in 1517). In England the revival of learning was fostered by Erasmus, Colet, Grocyn, More, and their fellows, about 1500, and in France there was a brilliant artistic and literary development under Louis XII (1498–1515) and Francis I (1515–47). Also, in English form, *renascence*.

I have ventured to give to the foreign word *Renaissance* — destined to become of more common use amongst us as the movement which it denotes comes, as it will come, increasingly to interest us — an English form [*Renascence*]. *M. Arnold*, Culture and Anarchy, iv., note.

The *Renaissance* and the Reformation mark the return to experience. They showed that the doctrine of reconciliation was at last passing from the abstract to the concrete. *E. Caird*, Philos. of Kant, p. 28.

II. *a.* [*cap.*] Of or pertaining to the Renaissance; in the style of the Renaissance. — **Renaissance architecture**, the style of building and decoration which succeeded the medieval, and was based upon study and emulation of the outward forms and ornaments of Roman art, though with imperfect understanding of their principles. This style had its origin in Italy in the first half of the fifteenth century, and afterward spread over Europe. Its main characteristic is an attempted return to the classical forms which had been the forerunners of the Byzantine and the medieval. The Florentine Brunelleschi (died about 1446) was one of the first masters of the style, having prepared himself by earnest study of the remains of the monuments of ancient Rome. From Florence the style was introduced into Rome, where the works of Bramante (died 1514) are among its finest examples, the chief of these being the palace of the Chancellery, the foundations of St. Peter's, part of the Vatican, and the small church of San Pietro in Montorio. One of the greatest achievements of the Renaissance is the dome of St. Peter's, the work of Michelangelo, but this must yield in grandeur of conception to the earlier Florentine dome of Brunelleschi. After Michelangelo the style declined rapidly. Another chief Renaissance school arose in Venice, where in the majority of the buildings of the sixteenth and seventeenth centuries predominance is given to external decoration. From this school sprang Palladio (1518–1580), whose distinctive style of architecture received the name of *Palladian*. Renaissance architecture was introduced into France by Lombardic and Florentine architects at the beginning of the sixteenth century, and flourished there during that century, but especially in the first half, under Louis XII. and Francis I. During the seventeenth century the style degenerated in France, as it had in Italy, and gave rise to the inorganic and insipid productions of the so-called *rococo* or Louis XV. style of the first half of the eighteenth century.

Renaissance Architecture — French Renaissance tomb of Louis le Brézé (died 1531), Grand Seneschal of Normandy, etc., in the cathedral of Rouen, erected by his wife Diane de Poitiers, and attributed to Jean Goujon and Jean Cousin.

In England the Renaissance style was introduced later than in France, and it is represented there by the works of Inigo Jones, Sir Christopher Wren, and their contemporaries — St. Paul's, London, being a grand example by Wren. While all Renaissance architecture is far inferior to medieval building of the best time, it represents a distinct advance over the debased and over-elaborated forms of the medieval decadence. For an Italian example, see cut under *Italian*, see also cuts under *loggia* and *Palladian*. — **Renaissance braid-work**, a kind of needle-work similar in its make to needle-point lace, but of much stouter material, as fine braid. — **Renaissance lace**, same as *Renaissance braid-work*. — **Renaissance painting**, next to architecture the chief art of the Renaissance, had by far its most important and characteristic development in Italy, where based upon the art of the Byzantine painters of the middle ages a number of important art-centers or schools arose, differing from one another in their ideals and methods, but all distinctively Italian. The central one of these schools was that of Florence, which took the lead under the impulse and example of the great artist Giotto in the early part of the fourteenth century. Among the greatest of those after Giotto, whose genius influenced the development of the art, were Fra Angelico (Fra Giovanni da Fiesole), Masolino, Masaccio, Filippo Lippi, Sandro Botticelli, Filippino Lippi, and Leonardo da Vinci. The chief glory of Renaissance painting is that it advanced that art beyond any point that it had attained before, or has since reached. For other schools of Renaissance painting see *Bolognese*, *Roman*, *Sienese*, *Umbrian*, *Venetian*, and see *Italian painting*, under *Italian*. — **Renaissance sculpture**, the sculpture of the Renaissance, characterized primarily by seeking its models and inspiration in the works of Roman antiquity, instead of in contemporary life, like medieval sculpture. As an adjunct to architecture, this sculpture reached its highest excellence in Italy and in France. Eminent names are those of Niccolà Pisano, Donatello, Ghiberti, Luca della Robbia, Sansovino, Sangallo, and Michelangelo (1475–1564), one of the half dozen names that rank as greatest in the world's art-history. See cut of Benvenuto Cellini's "Perseus and Medusa," under *Perseus*, and see under *quadra*, another example by Luca della Robbia. **Renaissance style**, properly the style of art and decoration (see *Renaissance architecture*) which prevailed in Italy during the fifteenth century and later, and the styles founded upon these which were in vogue in northern Europe at a date somewhat later — as in France from about 1520 to 1560. By extension the phrase is made to cover all the revived classic styles of the last four centuries, including the above, and to embrace everything which shows a strong classic influence. This use is generally avoided by French writers, who speak of the styles following the religious wars in France as the styles of Henry IV., Louis XIII., etc., excluding these from the Renaissance style proper, but English writers commonly include the whole period from 1400 to the French Revolution or the end of the eighteenth century, and divide it into various epochs or subordinate styles, according to the writer's fancy.

To *split* is primarily to divide lengthwise or by the grain: as, to *split* wood. *Cleave* may be a more dignified word for *split*, or it may express a cutting apart by a straight, heavy stroke. *Fracture* may represent the next degree beyond cracking, the lightest kind of breaking, leaving the parts in place as, a *fractured* bone or plate of glass, or it may be a more formal word for *break*. To *chop* is to cut apart with a heavy stroke, which is generally across the grain or natural cleavage, or through the narrow dimension of the material: *chopping* wood is thus distinguished from *splitting* wood.

2. In *law:* (*a*) A compensation or return made periodically, or fixed with reference to a period of time, for the possession and use of property of any kind.

>

> *Emerson*, Essays, 1st ser., p. 213.

(*b*) Technically, a definite compensation or return reserved by a lease, to be made periodically, or fixed with reference to a period of tenure, and payable in money, produce, or other chattels or labor, for the possession and use of land or buildings. Compensation of any other nature is not termed *rent*, because not enforceable in the same manner. The time of paying rents is either by the particular appointment of the parties in the deed, or by appointment of law, but the law does not control the express appointment of the parties, when such appointment will answer their intention. In England Michaelmas and Lady-day are the usual days appointed for payment of rents; and in Scotland Martinmas and Whitsunday.

> Take (deer Son) to thee
> This Farm's demains, . . .
> And th' only *Rent* that of it I reserue is
> One Trees fair fruit, to shew thy sute and service.
> *Sylvester*, tr. of Du Bartas's Weeks, ii., Eden.

Rent is said to be due at the first moment of the day appointed for payment, and in arrear at the first moment of the day following. *Encyc. Brit.*, XIV. 276.

(*c*) The right to such compensation, particularly in respect of lands. Rents, at common law, are of three kinds: *rent-service, rent-charge* or *fee-farm*

rent, and *rent-seck*. *Rent-service* is when some corporal service is incident to it, as by fealty and a sum of money; *rent-charge*, or *fee-farm rent*, is when the owner of the rent has no future interest or reversion expectant in the land, but the rent is reserved in the deed by a clause of distress for rent in arrear (in other words, it is a charge on lands, etc., in the form of rent, in favor of one who is not the landlord); *rent-seck* is a like rent, but without any clause of distress. There are also *rents of assize*, certain established rents of freeholders and copyholders of manors, which cannot be varied: also called *quit-rents*. These, when payable in silver, are called *white rents*, in contradistinction to rents reserved in work or the baser metals, called *black rents* or *black mail*.

3. In *polit. econ.*, that part of the produce of the soil which is left after deducting what is necessary to the support of the producers (including the wages of the laborers), the interest on the necessary capital, and a supply of seed for the next year; that part of the produce of a given piece of cultivated land which it yields over and above that yielded by the poorest land in cultivation under equal circumstances in respect to transportation, etc. The rent theoretically goes to the owner of the soil, whether cultivator or landlord. Also called *economic rent*.

Rent is that portion of the produce of the earth which is paid to the landlord for the use of the original and indestructible powers of the soil. It is often, however, confounded with the interest and profit of capital, and, in popular language, the term is applied to whatever is annually paid by a farmer to his landlord. *Ricardo*, Pol. Econ., ii.

The *rent*, therefore, which any land will yield, is the excess of its produce beyond what would be returned to the same capital if employed on the worst land in cultivation.
J. S. Mill, Pol. Econ., II. xvi. § 3.

Rent is that portion of the regular net product of a piece of land which remains after deducting the wages of labor and the interest on the capital usual in the country incorporated into it.
W. Roscher, Pol. Econ. (trans.), II. § 149.

No part of Ricardo's theory is more elementary or more unchallenged than this, that the *rent* of land constitutes no part of the price of bread, and that high *rent* is not the cause of dear bread, but dear bread the cause of high *rent*.
Rae, Contemporary Socialism, p. 428.

=Syn. *Repentance, Penitence, Contrition, Compunction, Regret, Remorse*, may express the sorrowful feeling of the wrong-doer in view of his conduct. *Regret* is quite as often used of wishing that one had not done that which is unwise; as applied to misconduct, it expresses the feeblest degree of sorrow for doing wrong; but it may contain no element of real *repentance*. *Repentance* goes beyond feeling to express distinct purposes of turning from sin to righteousness; the Bible word most often translated *repentance* means a change of mental and spiritual attitude toward sin. Strictly, *repentance* is the beginning of amendment of life; the word does not imply any greater degree of feeling than is necessary to bring about a change, whether the turning be from a particular sin or from an attitude of sin. *Penitence* implies a large measure of feeling, and applies more exclusively than *repentance* to wrong-doing as an offense against God and right. *Contrition*, literally breaking or bruising, is essentially the same as *penitence;* it is a deep, quiet, and continued sorrow, chiefly for specific acts. *Compunction*, literally pricking, is a sharp pang of regret or self-reproach, often momentary and not always resulting in moral benefit. It is more likely than remorse to result in good. *Remorse*, literally gnawing, is naturally sharper mental suffering than *compunction;* the word often suggests a sort of spiritual despair or hopelessness, paralyzing one for efforts to attain repentance.

repentant (rē-pen'tant), *a.* and *n.* [< ME. *repentant*, < OF. *repentant*, repentant, penitent, < ML. *repentien(t-)s*, ppr. of **repentire*, repent: see *repent*[1].] I. *a.* 1. Experiencing repentance; sorrowful for past conduct or words; sorrowful for sin.

Specifically — (*a*) In *insurance* and *law*, a verbal or written statement made on the part of the insured to the insurer, before or at the time of the making of the contract, as to the existence of some fact or state of facts tending to induce the insurer more readily to assume the risk, by diminishing the estimate he would otherwise have formed of it. It differs from a warranty and from a condition expressed in the policy, in being part of the preliminary proceedings which propose the contract, and its falsity does not vitiate the contract unless made with fraudulent intent or perhaps with respect to a material point, while the latter are part of the contract when completed, and non compliance therewith is an express breach which of itself avoids the contract. (*b*) In *Scots law*, the written pleading presented to a lord ordinary of the Court of Session when his judgment is brought under review.

5. An expostulatory statement of facts, arguments, or the like; remonstrance.

> He threatened "to send his jack boot to rule the country," when the senate once ventured to make a *representation* against his ruinous policy. *Brougham*.

6. In *psychol.*, the word chiefly used to translate the German *Vorstellung*, used in that language to translate the English word *idea*. See *idea*, 2 and 3. (*a*) The immediate object of cognition; anything that the soul is conscious of. This is now the commonest meaning of *Vorstellung*, and recent translators have most frequently rendered it by the word *idea*. (*b*) A reproduced perception.

H. Lewes*.

See *representative*, *n.*, 3. In Scots law the term is usually applied to the obligation incurred by an heir to pay the debts and perform the obligations incumbent upon his predecessor.

8. Share or participation, as in legislation, deliberation, management, etc., by means of regularly chosen or appointed delegates; or, the system by which communities have a voice in the direction of their own affairs, and in the making of their own laws, by means of chosen delegates: as, parliamentary *representation*.

M. C. Tyler, Amer. Lit., I. 154.

As for the principle of *representation*, that seems to have been an invention of the Teutonic mind; no statesman of antiquity, either in Greece or at Rome, seems to have conceived the idea of a city sending delegates armed with plenary powers to represent its interests in a general legislative assembly. *J. Fiske*, Amer. Pol. Ideas, p. 59.

In these small [Grecian] commonwealths *representation* is unknown; whatever powers may be entrusted to individual magistrates or to smaller councils, the supreme authority must rest with an assembly in which every qualified citizen gives his vote in his own person.
E. A. Freeman, Amer. Lects., p. 246.

9. A representative or delegate, or a number of representatives collectively.

The *representations* of the people are most obviously susceptible of improvement. *J. Adams*, Works, IV. 284.

Proportional representation, representation, as in a political assembly, according to the number of electors, inhabitants, etc., in an electoral district or other unit. This principle is recognized in the United States House of Representatives and in many other bodies, especially those of a popular character.—**Pure representation.** See *pure*.—**Syn. 3.** Show; delineation, portraiture, likeness, resemblance.

representational (rep′rē-zen-tā′shon-al), *a.* [< *representation* + *-al*.] Pertaining to or containing representation, in any sense; of the nature of representation.

We find that in "constructive imagination" a new kind of effort is often requisite in order to dissociate those *representational* complexes as a preliminary to new combinations. *J. Ward*, Encyc. Brit., XX. 57.

representationist (rep′rē-zen-tā′shon-ist), *n.* [< *representation* + *-ist*.] One who holds the doctrine of representationism.

The *representationists*, as denying to consciousness the cognisance of aught beyond a merely subjective phænomenon, are likewise idealists; yet, as positing the reality of an external world, they must be distinguished as cosmothetic idealists. *Hamilton*, Reid's Works, Note C, § 1.

representative (rep-rē-zen′ta-tiv), *a.* and *n.* [< F. *représentatif* = Pr. *representatiu* = Sp. Pg. *representativo* = It. *rappresentativo*, < ML. *repræsentativus*, < L. *repræsentare*, represent: see *represent*.] I. *a.* **1.** Representing, portraying, or typifying.

Representative [poesy] is as a visible history, and is an image of actions as if they were present, as history is of actions in nature as they are, (that is) past.
Bacon, Advancement of Learning, ii.

They relieve themselves with this distinction, and yet own the legal sacrifices, though *representative*, to be proper and real. *Bp. Atterbury.*

Men have a pictorial or *representative* quality, and serve us in the intellect. Behmen and Swedenborg saw that things were *representative*. Men are also *representative*—first, of things, and, secondly, of ideas.
Emerson, Representative Men, p. 14.

2. Acting as the substitute for or agent of another or of others; performing the functions of another or of others.

The more multitudinous a *representative* assembly may be rendered, the more it will partake of the infirmities incident to collective meetings of the people.
A. Hamilton, Federalist, No. 58.

3. Pertaining to or founded on representation of the people; conducted by the agency of delegates chosen by or representing the people: as, a *representative* government.

A *representative* government, even when entire, cannot possibly be the seat of sovereignty—the supreme and ultimate power of a State. The very term *representative* implies a superior in the individual or body represented.
Calhoun, Works, I. 190.

He [Cromwell] gave the country a constitution far more perfect than any which had at that time been known in the world. He reformed the *representative* system in a manner which has extorted praise even from Lord Clarendon. *Macaulay.*

4. In *biol.*: (*a*) Typical; fully presenting, or alone representing, the characters of a given class or group: as, in zoölogy and botany, the *representative* genus of a family.

(*b*) Representing in any group the characters of another and different group: chiefly used in the quinarian system; also, pertaining to such supposed representation: as, the *representative* theory. (*c*) In zoögeography, replacing; taking the place of, or holding a similar position: as, the llama is *representative* of the camel in America.—**5.** In *psychol.* and *logic*, mediately known; known by means of a representation or object which signifies another object.

The chief merit or excellence of a *representative* image consists in its distinctness or clearness.

H. Spencer, Prin. of Psychol., § 480.

Representative being, being as an immediate object of consciousness.—**Representative faculty**, the faculty of representing images which the reproductive faculty has evoked; the imagination.—**Representative function**, a function having the properties of $\phi(a, n)$, stated below, under *representative integral*.—**Representative integral**, an integral of the form

$$\int_A^B f_a \cdot \phi(a, n) \cdot da,$$

where f_a is a function of limited variation between A and another limit, B, exceeding b, while $\phi(a, n)$ is (1) such a function of a and the parameter n that the integral of it between the same limits is less than an assignable finite quantity, whatever value between A and B be given to b, and whatever value be given to n; and (2) is such that when n tends toward infinity, the integral of $\phi(a, n)$ from A to b, where b is greater than A and less than B, tends toward a constant finite value. This is called a *representative integral*, because it is equal to the function fA multiplied by a constant.—**Representative knowledge**, knowledge of a thing by means of a mental image, but not as actually existing.—**Representative primogeniture.** See *primogeniture*.

II. *n.* **1.** One who or that which represents another person or thing; that by which anything is represented or exhibited.

This breadth entitles him [Plato] to stand as the *representative* of philosophy.
Emerson, Representative Men, p. 44.

2. An agent, deputy, or substitute, who supplies the place of another or others, being invested with his or their authority: as, an attorney is the *representative* of his client or employer; specifically, a member of the British House of Commons, or, in the United States, of the lower branch of Congress (the House of Representatives) or of the corresponding branch of the legislature in some States.

Then let us drink the Stewartry,
Kerroughtree's laird, and a' that,
Our *representative* to be.
Burns, Election Ballads, i.

The tribunes of Rome, who were the *representatives* of the people, prevailed, it is well known, in almost every contest with the senate for life.
A. Hamilton, Federalist, No. 63.

There are four essentials to the excellence of a representative system:—That the *representatives* . . . shall be *representatives* rather than mere delegates.
Bryce, Amer. Commonwealth, I. 296.

3. In *law*: (*a*) One who occupies another's place and succeeds to his beneficial rights in such a way that he may also in some degree be charged with his liabilities. Thus, an heir or devisee, since, to the extent of the property to which he succeeds, he is liable for his ancestor's debts, is a *representative* of the ancestor; but the widow, who takes part of the estate as dower, without liability, is not deemed a *representative* of the deceased; nor is an officer or trustee who succeeds to the rights and powers of the office or trust a *representative* of his predecessor, for, though he comes under liability in respect of the office or trust as his predecessor did, he does not succeed to the liabilities which his predecessor had incurred. The executor or administrator is sometimes spoken of as the *representative* of the decedent, but is usually distinguished by being called the *personal representative*. (*b*) One who takes under the Statute of Descents or the Statute of Distributions, or under a will or trust deed, a share which by the primary intention would have gone to his parent had the parent survived to the time for taking. If a gift has vested in interest absolutely in the parent, then, upon the parent's death before it vests in possession, the child will take as successor in interest of the parent, but not as *representative* of the parent in this sense. But if the parent dies before acquiring any interest whatever, as where one of several heirs apparent dies before the ancestor, leaving a child or children, the other heirs take their respective shares as if the one had not died, and the child or children of the deceased take the share their deceased parent would have taken. In this case all who share are *representatives* of the ancestor in sense (*a*), and the child or children are also *representatives* of the deceased heir apparent in sense (*b*). See *representation*, 7.—**House of Representatives**, the lower branch of the United States Congress, consisting of members chosen biennially by the people. It consists at present (1903) of 386 members. In many of the separate States, also, the lower branch of the legislature is called the *House of Representatives*.—**Personal representative.** See *personal*.—**Real representative**, an heir at law or devisee.

2. The act or process of restoring parts of an organism that have been destroyed or removed.

Specifically — 3. The process whereby new individuals are generated and the perpetuation of the species is insured; the process whereby new organisms are produced from those already existing: as, the *reproduction* of plants or animals. (*a*) The reproduction of plants is effected either vegetatively or by means of spores or of seeds. Vegetative reproduction consists in the individualizing of some part of the parent organism. In low unicellular plants this is simply a process of fission, one cell dividing into two or more, much as in the formation of tissue, save that the new cells become independent. In higher plants this method obtains by the shooting and rooting of some fraction of the organism, as a branch, a joint of a rootstock, in *Begonia* even a part of a leaf; or through specially modified shoots or buds, as the gemmæ of some algæ, mosses, etc., the bulblets of some mosses, ferns, the tiger-lily, etc., the corms, bulbs, and tubers of numerous annual plants. The cells engaged in this mode of reproduction are simply those of the ordinary tissues. Very many, but not all, plants propagate in this manner; but all are capable of reproduction in other methods included under the term *spore-reproduction*, which is reproduction most properly so called. This is accomplished through special reproductive cells, each of which is capable of developing into an individual plant. These are produced either independently, or through the conjunction of two separate cells by which their protoplasm coalesces. These may also in a less perfect sense be called reproductive cells. Reproduction through the union of two cells is sexual; through an independent cell, asexual. Sexual reproduction proceeds either by conjugation (that is, the union of two cells apparently just alike, which may be either common vegetative cells or specialized in form) or by fertilization, in which a smaller but more active sperm-cell or male cell impregnates a larger, less active germ-cell or female cell. In cryptogamous plants both methods are common, and the reproductive cells are termed *spores*, or when of the two sexes *gametes*, the male being distinguished as *antherozoids*, the female as *oöspheres*. In flowering plants spore-reproduction is always sexual, fertilization becoming pollination, the embryo-sac in the ovule affording the female cell and the pollen-grain the male cell. But the union of these cells produces, instead of a detachable spore, an embryo or plantlet, which, often accompanied by a store of nutriment, is inclosed within an integument, the whole forming a seed. The production of seeds instead of spores is the most fundamental distinction of phanerogams. Spore-reproduction is consummated by the germination of the spore or seed, which often takes place after a considerable interval. (*b*) Among the lowest animals, in which no sex is recognizable, reproduction takes place in various ways, which correspond to those above described for the lowest plants. (See *conjugation*, *fission*, *gemmation*, and *sporulation*.) Among sexed animals, reproduction results from the fecundation of an ovum by spermatozoa, with or without sexual copulation, and with many modifications of the details of the process. (See *genesis*, 2, and words there given.) Many animals are hermaphrodite, containing both sexes in one individual, and maturing the opposite sexual elements either simultaneously or successively: such are self-impregnating or reciprocally fecundating, as the case may be. Reproduction may be effected also by a detached part of an individual, constituting a separate person (see *generative person*, under *generative*). Sexual may alternate with asexual reproduction (see *parthenogenesis*); but in the vast majority of animals, invertebrate as well as vertebrate, permanent and perfect distinction of sex exists, in which cases reproduction always and only results from impregnation of the female by the male in a more or less direct or intimate act of copulation, and extends to but one generation of offspring. The organs or system of organs by which this is effected are known as the *reproductive organs* or *system*. *Reproduction* is always exactly synonymous with *generation* (def. 1); less precisely with *procreation* and *propagation* in their biological senses. See *sex*.

4. That which is produced or revived; that which is presented anew; a repetition; hence, also, a copy.

The silversmiths . . . sold to the pilgrims *reproductions* in silver of the temple and its sculptures. *The Century*, XXXIII. 138.

5. In *psychol.*, the act of repeating in consciousness a group of sensations which has already been presented in perception.

Empirical synthesis of reproduction, an association by the principle of contiguity, depending on the associated ideas having been presented together or successively. — **Pure transcendental synthesis of reproduction**, an association of ideas such that one will suggest the other independent of experience, due to innate laws of the mind, and one of the necessary conditions of knowledge. — **Sexual reproduction.** See def. 3, and *sexual*. — **Synthesis of reproduction**, the name given by Kant to that association of ideas by which one calls up another in the mind.

reproductive (rē-prō-duk'tiv), *a.* [= F. *reproductif* = Pg. *reproductivo*, < ML. **reproductivus*, < **reproducere*, reproduce: see *reproduce*.] Of the nature of, pertaining to, or employed in reproduction; tending to reproduce: as, the *reproductive* organs of an animal.

Reproductive cells, in *bot.* See *reproduction*, 3 (*a*). — **Reproductive faculty**, in the psychology of Sir William Hamilton, the faculty of association of ideas, by virtue of which one suggests a definite other, but not including the faculty of apprehending an idea a second time. — **Reproductive function of order *n*.** See *function*. — **Reproductive imagination**, the elementary faculty by virtue of which one idea calls up another, of which memory and imagination, as popularly understood, are special developments. See *imagination*, 1.

Philosophers have divided *imagination* into two — what they call the *reproductive* and the productive. By the former they mean imagination considered simply as re-exhibition, representing the objects presented by perception — that is, exhibiting them without addition or retrenchment, or any change in the relations which they reciprocally held when first made known to us through sense. *Sir W. Hamilton*, Metaph., xxxiii.

Reproductive organs. (*a*) In *bot.*, the organs appropriated to the production of seeds or spores: in flowering plants, chiefly the stamens and pistils together with the accessory floral envelops; in cryptogams, mainly the antheridia and archegonia. (*b*) In *zoöl.*, those organs or parts of the body, collectively considered, whose function it is to produce and mature ova or spermatozoa or their equivalents, and effect the impregnation of the female by the male elements, or otherwise accomplish reproduction; the reproductive or generative system of any animal in either sex; the genitals, in a broad sense. The fundamental reproductive organ of all sexed animals is an indifferent genital gland, differentiated in the male as a testis, in the female as an ovary (or their respective equivalents); its ulterior modifications are almost endless. These organs are sometimes detached from the main body of the individual (see *person*, 8, and *hectocotylus*); they often represent both sexes in one individual; they are usually separated in two individuals of opposite sexes; they sometimes fail of functional activity in certain individuals of one sex (see *neuter*, *worker*). — **Reproductive system**, in *biol.*, the sum of the reproductive or generative organs in plants and animals; the generative system; the sexual system of those plants and animals which have distinction of sex. The term is a very broad one, covering not only all parts immediately concerned in generation, but others indirectly conducing to the same end, as devices for effecting fecundation, for protecting or nourishing the product of conception, for cross-fertilization (as of plants by insects), for attracting opposite sexes (as of animals by odorous secretions), and the like. See *secondary sexual characters*, under *sexual*.

The *Reptantia* were divided into *Holochlamyda*, *Pneumonochlamyda*, and *Siphonochlamyda*.

reptation (rep-tā'shon), *n.* [= F. *reptation*, < L. *reptatio(n-)*, a creeping, crawling, < *reptare*, pp. *reptatus*, creep, crawl: see *reptant*.] 1. The act of creeping or crawling on the belly, as a reptile does. *Owen*.—2. In *math.*, the motion of one plane figure around another, so as constantly to be tangent to the latter while preserving parallelism between different positions of its own lines; especially, such a motion of one figure round another precisely like it so that the longest diameter of one shall come into line with the shortest of the other. This motion was applied by John Bernoulli in 1705 to the rectification of curves. Let AB be a curve whose length is required; let this be reversed about its normal, giving the curve ABC, and let this be reversed about the line between its extremities, giving the spindle-shaped figure ABCD; let DEFG be a similar and equal figure turned through a right angle—then, if the first has a reptatory motion about the second, its center will describe a four-humped or quadrigibbous figure OPQRSTUV, with humps at P, R, T, V. Let this be placed in contact with a similar and equal figure so that a maximum and minimum diameter shall coincide, and receive a reptatory motion, then its center will describe an octogibbous or eight-humped figure. By a similar process, this will describe a sixteen-humped figure, etc. Each of these figures will have double the periphery of the preceding, and they will rapidly approximate toward circles. Hence, by finding the diameters of each, we approximate to the length of the original curve.

Reptilia[1] (rep-til'i-ą), *n. pl.* [NL., pl. of LL. *reptile*, a reptile: see *reptile*.] In *zoöl.*: (*a*) In Linnæus's system of classification (1766), the first order of the third class *Amphibia*, including turtles, lizards, and frogs. See *Amphibia*, 2 (*a*). [Disused.] (*b*) A class of cold-blooded oviparous or ovoviviparous vertebrated animals whose skin is covered with scales or scutes; the reptiles proper. There are two pairs or one pair of limbs, or none. The skull is monocondylian. The mandible articulates with the skull by a free or fixed quadrate bone. The heart has two auricles, generally not two completed ventricles; the ventricle gives rise to two arterial trunks, and the venous and arterial circulation are more or less mixed. Respiration is pulmonary, never branchial. No diaphragm is completed. There is a common cloaca of the digestive and urogenital systems, and usually two ponce, sometimes one, seldom none. There are an amnion and an allantois. *Reptilia* thus defined were formerly associated with batrachians in a class *Amphibia*; but they are more nearly related to birds, and when brigaded therewith form their part of a superclass *Sauropsida*. The only living representatives of *Reptilia* are turtles or tortoises, crocodiles or alligators, lizards or saurians, and snakes or serpents, respectively constituting the four orders *Chelonia*, *Crocodilia*, *Lacertilia*, and *Ophidia*; and one living lizard, known as *Hatteria*, *Sphenodon*, or *Rhynchocephalus*, forming by itself an order *Rhynchocephalia*. In former times there were other orders of strange and huge reptiles, as the *Ichthyopterygia* or *Ichthyosauria*, the ichthyosaurs; *Anomodontia*; *Dinosauria*, by some ranked as a subclass and divided into several orders; *Ornithosauria* or *Pterosauria*, the pterodactyls; and *Plesiosauria* or *Sauropterygia*, the plesiosaurs. 2. A commonwealth; a government in which the executive power is vested in a person or persons chosen directly or indirectly by the body of citizens entitled to vote. It is distinguished from a monarchy on the one hand, and generally from a pure democracy on the other. In the latter case the mass of citizens meet and choose the executive, as is still the case in certain Swiss cantons. In a republic the executive is usually chosen indirectly, either by an electoral college as in the United States, or by the National Assembly as in France. Republics are oligarchic, as formerly Venice and Genoa, military, as ancient Rome, strongly centralized, as France, federal, as Switzerland, or, like the United States, may combine a strong central government with large individual powers for the several states in their particular affairs. See *democracy*.

> We may define a *republic* to be . . . a government which derives all its powers directly or indirectly from the great body of the people, and is administered by persons holding their offices during pleasure, for a limited period, or during good behaviour. *Madison*, The Federalist, No. 39.

> The constitution and the government [of the United States] . . . rest, throughout, on the principle of the concurrent majority; and . . . it is, of course, a *Republic*, a constitutional democracy, in contradistinction to an absolute democracy; and . . . the theory which regards it as a government of the mere numerical majority rests on a gross and groundless misconception. *Calhoun*, Works, I. 185.

Its candidate was indorsed by the Democratic convention, but was defeated, and the party soon disappeared.—**Republican calendar**. See *calendar*.—**Republican era**, the era adopted by the French soon after the proclamation of the republic, and used for a number of years. (*b*) In *U. S. hist.*: (1) The usual name of the Democratic party (in full *Democratic-Republican* party) during the years following 1792–3: it replaced the name *Anti-Federal*, and was replaced by the name *Democratic*. To replenish the fund the government sold bonds—$50,000,000 of 5 per cent. bonds in January, 1894; $50,000,000 of 5 per cent. bonds in November, 1894; about $62,000,000 of 4 per cent. bonds in February, 1895; and $100,000,000 of 4 per cent. bonds in January, 1896.—**In reserve,** in store; in keeping for other or future use.—**Reserve air.** Same as *residual air* (which see, under *air*[1]).—**Without reserve.** See the quotation.

When a sale is announced as *without reserve*—whether the announcement be contained in the written particulars or be made orally by the auctioneer—that, according to all the cases, both at law and in equity, means not merely that the property will be peremptorily sold, but that neither the vendor nor any one acting for him will bid at the auction. *Bateman.*

A man may have two residences, but only one can be his domicile. The bankruptcy law uses the term *residence* specifically, as contradistinguished from *domicile*, so as to free cases under it from the difficult and embarrassing presumptions and circumstances upon which the distinctions between *domicile* and *residence* rest. (*Faraday.*) In such cases there is said to be electric absorption. It is doubtless due to the fact that the solid dielectric does not immediately recover from the strain resulting from the electric stress. Also called *dielectric after-working.*—**Residual estate**, residuary estate.—**Residual figure**, in *geom.*, the figure remaining after subtracting a less from a greater.—**Residual magnetism.** See *magnetism.*—**Residual quantity**, in *alg.*, a binomial connected by the sign — (minus): thus, $a - b$, $a - \sqrt{b}$ are *residual quantities.*

An earlier definition, amounting to the same thing, was the coefficient of x^{-1} in the development of the function a in a sum of two series, one according to ascending, the other according to descending powers of x. If the oval includes only one value for which the function becomes infinite, the residual is said to be taken for or with respect to that value. Also *residue.*

3. A system of points which, together with another system of points of which it is said to be the residual, makes up all the intersections of a given curve with a plane cubic curve.—**Integral residual** the residual obtained by extending the integration round a contour including several values of the variable for which the function becomes infinite.—**Total residual**, the residual obtained by integrating round a contour including all the values of the variable for which the function becomes infinite. It. *resina*, < L. *resina*, prob. < Gr. ῥητίνη, resin (of the pine).] 1. (*a*) A hardened secretion found in many species of plants, or a substance produced by exposure of the secretion to the air. It is allied to and probably derived from a volatile oil. The typical resins are oxidized hydrocarbons, amorphous, brittle, having a vitreous fracture, insoluble in water, and freely soluble in alcohol, ether, and volatile oils. They unite with alkalis to form soaps. They melt at a low heat, are non-volatile, and burn quickly with a smoky flame. The hardest resins are fossilized like amber and copal, but they show all gradations of hardness through oleoresins and balsams to essential oils. The *hard resins* are nearly inodorous, and contain little or no volatile oil; the *soft resins* owe their softness to the volatile oil associated with them. The common resin of commerce exudes in a semi-fluid state from several species of pine (in the United States, chiefly the long-leaved pine). From this the oil of turpentine is separated by distillation. Resins are largely used in the preparation of varnishes, and several are used in medicine. See *gum.* (*b*) The precipitate formed by treating a tincture with water.

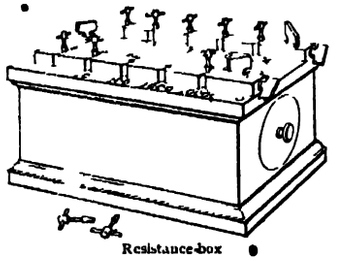
2. The force exerted by a fluid or other medium to retard the motion of a body through it; more generally, any force which always acts in a direction opposite to the residual velocity, or to any component of it: as, *resistance* to shearing. In a phrase like this, *resistance* may be defined as a stress produced by a strain, and tending to restoration of figure. But the resistance is not necessarily elastic—that is, it may cease, and as resistance does cease, when the velocity vanishes. In the older dynamical treatises, resistance is always considered as a function of the velocity, except in the case of friction, which does not vary with the velocity, or at least not much. In modern hydrodynamics the viscosity is taken into account, and produces a kind of resistance partly proportional to the velocity and partly to the acceleration. The theory of resistance still remains imperfect.

Energy, which is force acting, does work in overcoming *Resistance,* which is force acted on and reacting. *G. H. Lewes*, Probs. of Life and Mind, II. v. § 5.



3. In *elect.*, that property of a conductor in virtue of which the passage of a current through it is accompanied by a dissipation of energy; the transformation of electric energy into heat. It is one of the two elements upon which the strength of an electric current depends when the flow is steady; the other is electromotive force, and the relation between them is generally expressed by the equation $C = E/R$, which is Ohm's law. *Resistance* may therefore be defined as the ratio of the electromotive force to the current strength ($R = E/C$), the flow being assumed to be steady. For simple periodic alternate currents, the resistance increases as the rapidity of alternation increases, and it also depends on the form of the conductor. Resistance to such currents is sometimes called *impedance* and also *virtual resistance,* that for steady flow being named *ohmic resistance.* In general, resistance is proportional to the length of the conductor and inversely proportional to its cross-section. It also varies with the temperature of the conductor, the nature of the material of which it is composed, the stress to which it is subjected, and in some instances with other physical conditions, as in the case of selenium, the resistance of which diminishes as the intensity of the

light to which it is exposed increases. It is the reciprocal of conductivity. The unit of resistance is the ohm (which see). The designation *resistance* is also applied to coils of wire or other material devices which are introduced into electric circuits on account of the resistance which they offer to the passage of the current. The resistance of a conductor may be measured by Wheatstone's bridge. This is a device for the accurate comparison of electric resistances, invented by Christie and brought into notice by Wheatstone. It consists essentially of a complex circuit of six conductors, arranged as shown in the cut. A current from the battery B enters at the junction of *a* and *c*, and after dividing into parts depending on the relative resistances of the branches *a*, *b*, *c* and *d*, returns to the battery through the junction of *b* and *d*. G is a galvanometer joined to the junctions *a b* and *c d*. When the relative resistances are such that $a : b :: c : d$ no current will flow through the galvanometer. If *a* and *b* are comparable and adjustable resistances, it is only necessary to establish this condition in order to know the ratio of *c* to *d*. Many modifications of the bridge have been devised. —**Center of resistance**. See *center*. —**Conduction resistance**, the resistance offered by a conductor to an electric current. **Contact resistance**. See *contact*. **Curve of elastic resistance**. See *curve*. —**Living resistance**, the work required to produce a sudden strain of a body, especially a sudden elongation of a solid. —**Magnetic resistance**, the reciprocal of magnetic conductivity or permeability. The magnetic flux or total number of magnetic lines of force passing through a cross section of any magnetic circuit, may be given in an expression analogous to that giving the strength of an electric current in terms of the electromotive force and resistance. The denominator of the fraction represents the magnetic resistance sometimes called *magnetic reluctance*. —**Passive resistance**, a friction or similar force opposing the motion of a machine. —**Principle of least resistance**, the principle that when a structure is in equilibrium the passive forces or stresses occasioned by minute strains are the least that are capable of balancing the active forces or those which are independent of the strains. —**Solid of least resistance**, in *mech.*, the solid whose figure is such that in its motion through a fluid it sustains less resistance than any other having the same length and base, or on the other hand being stationary in a current of fluid, offers the least interruption to the progress of that fluid. In the former case it has been considered the best form for the stem of a ship; in the latter the proper form for the pier of a bridge. The problem of finding the solid of least resistance was first proposed and solved by Newton, but only for hypothetical conditions extremely remote from those of nature. **Specific resistance**, the resistance offered by a conductor of any given material the length of which is one centimeter and the cross section one square centimeter. **Transition resistance**, the resistance to an electric current in electrolysis caused by the presence of the ions at the electrodes. —**Syn. 1** Hindrance, antagonism, check. See *oppose*.

(*b*) The prolongation or increase of sound by the sympathetic vibration of other bodies than that by which it is originally produced. It is carefully utilized in musical instruments, as by means of the sounding-board of a pianoforte, the body of a violin, or the tube of a horn. In many wind-instruments, like the flute, and the flue-pipes of an organ, the pitch of the tone is almost wholly determined by the shape and size of the resonant cavity or tube. In the voice, the quality of both song and speech and the distinctions between the various articulate sounds are largely governed by the resonance of the cavities of the pharynx, mouth, and nose. 3. In *med.*, the sound evoked on percussing the chest or other part, or heard on auscultating the chest while the subject of examination speaks either aloud or in a whisper.—**Amphoric resonance,** a variety of tympanitic resonance in which there is a musical quality.—**Bandbox resonance,** the vesiculotympanitic resonance occurring in vesicular emphysema.—**Bell-metal resonance,** a ringing metallic sound heard in auscultation in pneumothorax and over other large cavities, when the chest is percussed with two pieces of money, one being used as pleximeter.—**Cough resonance,** the sound of the cough as heard in auscultation.—**Cracked-pot resonance,** a percussion sound obtained sometimes over cavities, but also sometimes in health, resembling somewhat the sound produced by striking a cracked pot.—**Normal pulmonary resonance, normal vesicular resonance.** Same as *vesicular resonance.*—**Resonance globe,** a resonator tuned to a certain musical tone.—**Skodaic resonance,** resonance more or less tympanitic above a pleuritic effusion.—**Sympathetic resonance.** See *sympathetic.*—**Tympanitic resonance,** such resonance as is obtained on percussion over the intestines when they contain air. It may also be heard in the thorax over lung-cavities, in pneumothorax, and otherwise.—**Vesicular resonance,** resonance of such quality as is obtained by percussion over normal lung-tissue. Also called *normal vesicular resonance* and *normal pulmonary resonance.*—**Vesiculotympanitic resonance,** pulmonary resonance intermediate between vesicular and tympanitic resonance.—**Vocal resonance,** the sound heard on auscultation of the chest when the subject makes a vocal noise.—**Whispering resonance,** the sound of a whisper as heard in resonance.

The act of breathing again or resuming life.

Appear of *respiration* to the just,
And vengeance to the wicked.
Milton, P. L., xii. 540.

2. The inspiration and expiration of air.—3. That function by which there takes place an absorption of oxygen from the surrounding medium into the blood with a corresponding excretion of carbon dioxid. This is accomplished in the higher animal forms chiefly by the lungs and skin; the gills or branchiæ of aquatic animals and the tracheæ of insects perform the same function. In unicellular organisms these changes take place in the protoplasm of the cell itself. The number of respirations in the human adult is from 16 to 24 per minute. About 500 centimeters or one sixth of the volume of the air in the lungs is changed at each respiration, giving a daily income of about 744 grams of oxygen and an expenditure of 900 grains of carbon dioxid. Inspiration is slightly shorter than expiration.

Ev'ry breath, by *respiration* strong
Forc'd downward. *Cowper*, Task, iv. 348.

4. In *physiological bot.*, a process consisting in the absorption by plants of oxygen from the air, the oxidation of assimilated products, and the release of carbon dioxid and watery vapor. It is the opposite of *assimilation*, in which carbon dioxid (carbonic acid) is absorbed and oxygen given off—contrasted also as being the waste process in the plant economy, a part of the potential energy of a higher compound being converted into kinetic energy, supporting the activities of the plant, the resulting compound of lower potential being excreted. Respiration takes place in all active cells both by day and by night; assimilation only by daylight (then overshadowing the other process) and in cells containing chlorophyl.

5. The respiratory murmur.—6†. A breathing-spell; an interval.

Some meet *respiration* of a more full trial and enquiry into each others' condition.
Bp. Hall, Cases of Conscience, iv. 6.

Abdominal respiration. See *abdominal*. **Amphoric respiration,** respiratory murmur with musical intonation, such as might be produced by blowing across the mouth of a bottle. It occurs in some cases of pneumothorax and with some phthisical cavities.—**Artificial respiration,** respiration induced by artificial means. It is required in cases of drowning, the excessive inhalation of chloroform or of noxious gases, etc. In the case of a person apparently drowned, or in an asphyxiated condition, the following treatment has been recommended. After clearing the mouth and throat, the patient should be laid on his back on a plane inclined a little from the feet upward; the shoulders gently raised by a firm cushion placed under them; the tongue brought forward so as to project from the side of the mouth, and kept in that position by an elastic band or string tied under the chin. Remove all tight clothing from neck and chest. The arms should then be grasped just above the elbows, raised till they nearly meet above the head, and kept stretched upward for two seconds: this action imitates inspiration. The arms are then turned down and firmly pressed for two seconds against the sides of the chest, thus imitating a deep expiration. These two sets of movements should be perseveringly repeated at the rate of fifteen times in a minute. As soon as a spontaneous effort to breathe is perceived, cease the movements and induce circulation and warmth. —**Branchial respiration.** See *branchial*.—**Bronchial respiration,** respiration such as is heard immediately over bronchi, or over the trachea. The inspiratory sound is high in pitch and tubular; the expiratory sound is higher, tubular, and prolonged. It is heard in disease over consolidated lungs. Also called *tubular respiration*.—**Bronchocavernous respiration,** respiration intermediate in character between bronchial and cavernous respiration.—**Bronchovesicular respiration,** respiration intermediate in character between bronchial and vesicular respiration.—**Cavernous respiration.** See *cavernous*.—**Center of respiration,** the nervous center which regulates respiration. It is automatic in action, but is guided by incoming influences from the vagus, the skin, and elsewhere. The main center is limited in extent, and situated in the floor of the fourth ventricle, near the point of the calamus.—**Cerebral respiration,** shallow, quick, irregular, more or less sighing respiration, sometimes resulting from cerebral disease in children.—**Cheyne-Stokes respiration,** a rhythmic form of respiration described by Cheyne in 1818 and by Stokes in 1846. It consists of a series of cycles in every one of which the respirations pass gradually from feeble and shallow to forcible and deep, and then back to feeble again. A pause follows, and then the next cycle begins with a feeble inspiration. This symptom has been found associated with cardiac and brain lesions.—**Cogged** or **cog-wheel respiration.** Same as *interrupted respiration*.—**Costal respiration,** respiration in which the costal movements predominate over the diaphragmatic.—**Cutaneous respiration,** gaseous absorption and excretion by the skin.—**Diaphragmatic respiration.** Same as *abdominal respiration* (which see, under *abdominal*).—**Divided respiration,** respiration in which inspiration is separated from expiration by a well-marked interval.—**Facial respiration,** respiratory movements of the face, as of the alæ nasi.—**Harsh respiration.** Same as *rude respiration*.—**Indeterminate respiration.** Same as *bronchovesicular respiration*, especially its more vesicular grades.—**Interrupted respiration,** respiration in which the inspiratory, sometimes the expiratory, sound is broken into two or more parts. Also called *jerking*, *wavy*, and *cogged* or *cog-wheel respiration*.—**Jerking respiration.** Same as *interrupted respiration*.—**Laryngeal respiration,** laryngeal respiratory movements.—**Metamorphosing respiration,** respiration in which the first part of the inspiratory sound is tubular and the last part cavernous.—**Organs of respiration,** any parts of the body by means of which constituents of the blood are interchanged with those of air or water. In the higher vertebrates, all of which are air-breathers, such organs are internal, and of complex lobulated structure, called *lungs*. (See *lung*.) In lower vertebrates and many invertebrates respiration is effected by breathing water, and such organs are usually called *gills* or *branchiæ*. Most invertebrates, however (as nearly all the immense class of insects), breathe air by various contrivances for its admission to the body, generally of tubular or laminated structure, which may open by pores or spiracles on almost any part of the body. The organs of mollusks are extremely variable in form and position; they are commonly called *branchiæ* or *gills*, technically *ctenidia*. Some gastropods, called *pulmonate*, are air-breathers. Arachnidans are distinguished as *pulmonate* and *tracheate*, according to the laminate (or saccular) or the simply tubular character of their organs of respiration. The character of the lungs as offsets of the alimentary canal is somewhat peculiar to the higher vertebrates—being represented in the lower, as fishes, only by an air-bladder, if at all; and the various organs of respiration of lower animals are only analogous or functionally representative, not homologous or morphologically representative, of such lungs. (See *pneogaster*.) In birds the organs are distributed in most parts of the body, even in the interior of bones. (See *pneumatocyst*.) In embryos the allantois is an organ of respiration, as well as of digestion and circulation. See cuts under *Branchiostoma*, *gill*, and *Mya*.—**Puerile respiration.** See *puerile*.—**Rough respiration.** Same as *rude respiration*.—**Rude respiration,** a form of bronchovesicular respiration, the sounds being harsh.—**Supplementary respiration,** respiration with increased vesicular murmur, as heard over normal parts of the lungs when some other part of them is incapacitated, as from pneumonia or pleurisy.—**Thoracic respiration.** Same as *costal respiration*.—**Tubular respiration.** Same as *bronchial respiration*.—**Vesiculocavernous respiration,** respiration intermediate in character between vesicular and cavernous respiration.

It is mostly used to exclude the passage into the lungs of cold air, smoke, dust, and other noxious substances, especially by persons having delicate chests, by firemen, cutlers, grinders, and the like, and by divers in operations under water. Respirators for persons with weak lungs have several plies of fine gauze made of highly heat-conducting metal, which warms the air as it passes through. See *aërophore*.

This hook also is called *rest*. A similar hook was sometimes arranged so far at the side, and so projecting, as to receive the lance itself; but, this form being inconvenient, the projecting hook was arranged with a hinge. In the justs of the fifteenth and sixteenth centuries the heavy lance was found to require a counterpoise, and the rest was made double, the hook projecting sidewise, and a long tongue or bar projecting backward under the arm with a sort of spiral twist at the end to prevent the butt of the lance from rising, so that the lance was held firmly, and required from the juster only the exertion of directing its point.

The duration of a rest, as of a note, may be extended one half by a dot, as 𝄽. (= 𝄽 𝅘𝅥𝅯), or indefinitely by a hold, 𝄐. They have erect and leafless stems from a scaly rootstock, very much branched or entirely without branches, with numerous scattered sheaths replacing the leaves, or sometimes in the young plant bearing a small and perishable leaf-blade. Conf. of Faith*, xxxii. 2. (2) As a resurrection from the dead, a coming forth from the place of the departed, but without the body with which the spirit was clothed in life, either with no body or with a new body given for the new life, and one either having no connection with the present earthly body or none that can be now apprehended for example, "Resurrection of the Body, as taught in the New Testament, is not a Rising again of the same Body but the Ascent into a higher Body." *J. F. Clarke*, Orthodoxy, its Truths and Errors, xii § 6. (3) The doctrine of Swedenborg, that every man is possessed of two bodies, a natural and a spiritual, the latter within the former, and that at death the natural body is laid aside and the spiritual body rises at once from the death of the natural, resurrection thus taking place for every one immediately upon and simultaneously with death. It. *retina,* < NL. *retina,* retina: so called because resembling fine network, < L. *rete,* a net: see *rete.*] The innermost and chiefly nervous coat of the posterior part of the eyeball, between the choroid coat and the vitreous humor. It extends from the entrance into the eyeball of the optic nerve toward the crystalline lens, terminating in the ora serrata. A modified division of the retinal structure is, however, continued forward as the pars ciliaris retinæ. The retina consists of a delicate and complex expansion and modification of the optic nerve, supported by a network of connective tissue. It may be divided into ten layers (1) internally, next the hyaloid membrane of the vitreous humor, the internal limiting membrane, formed of the expanded bases of the fibers of Müller, (2) the fibers of the optic nerve; (3) layer of ganglion cells, (4) internal molecular or granular layer, (5) inner nuclear layer, (6) external molecular or granular layer, (7) external nuclear layer, (8) external limiting membrane, which is connected with the ends of Müller's fibers; (9) layer of rods and cones, or bacillary layer, (10) pigmentary layer. In the center of the back part of the retina, near the line of the optic axis, is the macula lutea, the most sensitive part of the retina, and in the center of the macula is a depression, the fovea centralis, in which the rods are absent. The color of the macula is due to a yellow pigment. About one tenth of an inch internally to the fovea is the point of entrance of the optic nerve with its central artery, the retina is incomplete at this point, and constitutes the "blind spot." The nerve-fibers have been estimated to number 400,000 broad and as many narrow fibers, and for each fiber there are 7 cones, 100 rods, and 7 pigment-cells. The retina serves the purpose of vision in being the organ through or by means of which vibrations of luminiferous ether excite the optic nerve to its appropriate activity. J. M. Neale, tr. of Bernard of Cluny.

Retribution theory, the theory that the condition of the soul after death depends upon a judicial award of rewards and punishments based upon the conduct pursued and the character developed in this life. It is distinguished from the theory that the future life is (*a*) simply a continuance of the present (continuance theory); (*b*) a life of gradual development by means of discipline (purgatory), or future redemptive influences (future probation).

On the whole, however, in the religions of the lower range of culture, unless where they may have been affected by contact with higher religions, the destiny of the soul after death seems comparatively seldom to turn on a judicial system of reward and punishment. Such difference as they make between the future conditions of different classes of souls seems often to belong to a remarkable intermediate doctrine, standing between the earlier continuance theory and the *retribution theory.*

=**Syn.** 1. *Revenge, Vengeance, Retribution, Retaliation*, and *Reprisal* agree in expressing the visiting of evil upon others in return for their misdeeds. *Revenge* is the carrying out of a bitter desire to injure an enemy for a wrong done to one's self or to those who seem a part of one's self, and is a purely personal feeling. It generally has reference to one's equals or superiors, and the malignant feeling is all the more bitter when it cannot be gratified. *Vengeance* has an earlier and a later use. In its earlier use it may arise from no personal feeling, but may be visited upon a person for another's wrong as well as for his own. In the Scripture it means retribution with indignation, as in Rom. xii. 19 "*Vengeance* is mine, I will repay, saith the Lord," where it is a reservation for Jehovah of the offices of distributive and retributive justice. In its later use it involves the idea of wrathful retribution, whether just, unjust, or excessive; it is often a furious revenge: hence there is a general tendency to turn to other words to express just retribution, especially as an act of God. *Retribution* bears more in mind the amount of the wrong done, viewing it as a sort of loan whose equivalent is in some way paid back. Any evil result befalling the perpetrator of a bad deed in consequence of that deed is said to be a *retribution*, whether occurring by human intention or not; personal agency is not prominent in the idea of *retribution*. *Retaliation* combines the notion of equivalent return, which is found in *retribution* with a distinctly personal agency and intention, sometimes, unlike the preceding words, it has a light sense for good humored teasing or banter. *Reprisal* is an act of retaliation in war, its essential point being the capture of something in return or as indemnification for pecuniary damage from the other side. The word has also a looser figurative meaning, amounting essentially to retaliation of any sort. See *avenge, requital*, and the definition of *retortion*.

The observation of such a bright line spectrum, first made by Professor C. A. Young in 1870, and since repeated more or less completely by several eclipse observers, led to the hypothesis. 2. The act of moving completely around a circular or oval course, independently of any rotation. In a revolution without rotation, every part of the body moves by an equal amount, while in rotation the motions of the different parts are proportional to their distances from the axis. But revolution and rotation may be combined. Thus, the planets perform *revolutions* round the sun, and at the same time *rotations* about their own axes. The moon performs a *rotation* on its axis in precisely the same time in which it performs a *revolution* round the earth, to which it consequently always turns the same side.

The term *Revolution*, in English history is applied distinctively to the convulsion by which James II was driven from the throne in 1688. The elections generally fell upon men of *revolution* principles. *Smollett*, Hist. Eng., I. 6.

The *revolution* as it is called produced no other changes than those which were necessarily caused by the declaration of independence. *Calhoun*, Works, I. 189.

Hostilities began in 1775; independence was declared in 1776, and the help of France was formally secured in 1778. The war was practically ended by the surrender of the chief British army at Yorktown in 1781, and the independence of the United States was recognized by treaty of peace in 1783. **Anomalistic revolution**. See *anomalistic*. **English Revolution**, the movements by which James II was forced to leave England and a purer constitutional government was secured through the aid of William of Orange, who landed with an Anglo-Dutch army in November, 1688. In 1689 William and Mary were proclaimed constitutional sovereigns, and Parliament passed the Bill of Rights.—**French Revolution**, the series of movements which brought about the downfall of the old absolute monarchy in France, the establishment of the republic, and the abolition of many abuses. The States-General assembled in May, 1789, and the Third Estate at once took the lead. The Bastille was stormed by the people, and in the same year the Constituent Assembly overthrew feudal privileges and transferred ecclesiastical property to the state. Abolition of titles and of right of primogeniture and other reforms were effected in 1790. The next year a constitution was adopted and the Constituent was succeeded by the Legislative Assembly. In 1792 a coalition of nations was formed against France, the royal family was imprisoned, and in September the Convention replaced the Legislative Assembly and proclaimed the republic. Louis XVI was executed in 1793, and the Reign of Terror followed in 1793–4, royalist risings were suppressed, and the foreign wars successfully prosecuted. The revolutionary period may be regarded as ending with the establishment of the Directory in 1795, or as extending to the founding of the Consulate in 1799, or even later. Other French revolutions in 1830, 1848, and 1870 resulted respectively in the overthrow of the Bourbon monarchy of the Restoration, of the monarchy of Louis Philippe, and of the Second Empire.—**Pole of revolution**. ly—(*a*) A revolving firearm, especially a pistol, having a revolving barrel provided with a number of bores (as in earlier styles of the weapon), or (as in modern forms) a single barrel with a revolving cylinder at its base, provided with a number of chambers. When the barrel or cylinder revolves on its longitudinal axis, the several bores or chambers are brought in succession into relation with firing-mechanism for successive and rapid firing. In the modern forms of the arm the chambers of the cylinder are, by such revolution, brought successively into line with the bore in the barrel, which is also the firing position. In this position each chamber respectively forms a continuation of the bore in the barrel. Six is the common number of chambers. The most vital distinction between early and modern revolving firearms is that the barrels of the former were directly revolved by the hand, while in the latter the revolving-mechanism is connected with the firing-mechanism, the cocking of which automatically revolves the cylinder. Metal cartridges with conical bullets are used in all modern revolvers, the loading being done at the breech. Some are self-cocking—that is, are cocked by pulling the trigger which also discharges them. Some, by peculiar mechanism (though, for general use, they may be cocked in the ordinary way for taking deliberate aim), are by a quick adjustment changed into self-cocking pistols for more rapid firing in emergencies where accurate aim is of subordinate importance. Colonel Colt of the United States was the first to produce a really serviceable and valuable revolving arm, though the principle was known in the earlier part of the sixteenth century. (*b*) A revolving cannon.—3. A revolving horse-rake.

Unlike the revolving furnace for chloridizing ores, this furnace has no interior partition. The heat is supplied by a Siemens regenerative gas-furnace, or by a coal-furnace, and the hot flame circulates longitudinally through the cylinder into a smoke-stack or chimney. The charging is done through a hole in the side of the cylinder, and the crude soda, rolled into balls by the motion of the cylinder, is discharged through the same opening.—**Revolving pistol.** Same as *revolver*.—**Revolving press.** See *press*[1].—**Revolving storm**, a cyclone.
